## Introduction

The St. Luke's Wood River Community Health Needs Assessment (CHNA) is designed to help us better understand the most significant health challenges facing the individuals and families in our service area. The information, conclusions, and needs identified in our assessment will assist us in:

- Developing health improvement programs for our community
- Providing better care at lower cost
- Defining our operational and strategic plans
- Fulfilling our mission: "To improve the health of people in our region"

Stakeholder involvement in determining and addressing community health needs is vital to our process. We thank, and will continue to collaborate with, all the dedicated individuals and organizations working with us to make our community a healthier place to live.

For the purpose of sharing the results of this assessment with the community we serve, a complete copy is available on our public website.

## Executive Summary

The St. Luke’s Wood River 2016 Community Health Needs Assessment (CHNA) provides a comprehensive analysis of our community’s most important health needs. Addressing our health needs is an essential opportunity to achieve improved population health, better patient care, and lower overall health care costs.

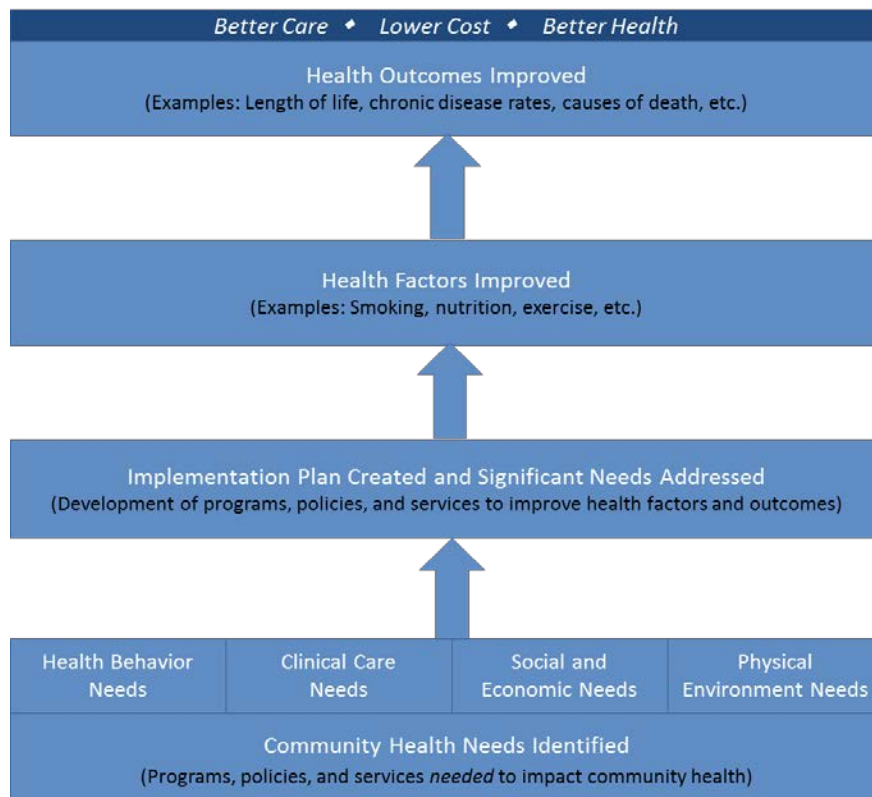

In our CHNA, we divide our health needs into four distinct categories: 1) health behaviors; 2) clinical care; 3) social and economic factors; and 4) physical environment. Each identified health need is included in one of these categories.

We employ a rigorous prioritization system designed to rank the health needs based on their potential to improve community health. Our health needs are identified and measured through the study of a broad range of data, including:

- In-depth interviews with a diverse group of dedicated community representatives
- An extensive set of national, state, and local health indicators collected from governmental and other authoritative sources

The chart, below, provides a graphical summary of the approach used to develop our CHNA.

### St. Luke’s Approach to Improving Community Health

## Significant Community Health Needs

Health needs with the highest potential to improve community health are those ranking in the top 10<sup>th</sup> percentile of our prioritization system. After identifying the top ranking health needs, we organize them into groups that will benefit by being addressed together as shown below:

Group #1: Improve Mental Health and Reduce Suicide and Substance Abuse

Group #2: Improve the Prevention and Management of Obesity

Group #3: Improve Access to Affordable Health Insurance

We call these high ranking needs our “significant health needs” and provide a summary of each of them next.

## Significant Health Need #1: Improve Mental Health and Reduce Suicide and Substance Abuse

Improving mental health and reducing suicide and substance abuse rank among our most significant health needs. This is because our community representatives scored mental health, the availability of behavioral health providers, and substance abuse as some of our

most significant health needs. In addition, Idaho has one of the highest percentages (23.3%) of any mental illness (AMI) in the nation, shortages of mental health professionals in all counties across the state, and suicide rates that are consistently higher than the national average. Depression is the most common type of mental illness, affecting more than 26% of the U.S. adult population. It has been estimated that by the year 2020, depression will be the second leading cause of disability throughout the world. Further, the percent of people who report using illicit drugs in our service area is more than twice as high as Idaho as a whole.

### Impact on Community

Good mental health is “a state of well-being in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community.” It is estimated that only about 17% of U.S adults are considered to be in a state of optimal mental health.<sup>1</sup>

Reducing drug abuse can have a positive impact on society on multiple levels as well. Directly or indirectly, every community is affected by drug abuse and addiction, as is every family. This includes health care expenditures, lost earnings, and costs

---

<sup>1</sup> <http://www.cdc.gov/mentalhealth/basics.htm>

associated with crime and accidents. This is an enormous burden that affects all of society - those who abuse these substances, and those who don't. Families can be destroyed by drug abuse. Approximately 50% to 80% of all child abuse and neglect cases substantiated by child protective services involve some degree of substance abuse by the child's parents.<sup>2</sup> It is estimated that in 2007 illicit drug use cost the U.S. economy more than \$193 billion. The cost of illegal drug use is similar to government estimates on the cost of diabetes.<sup>3</sup>

#### **How to Address the Need:**

There is a high prevalence of comorbidity between drug use disorders and other mental illnesses. The high rate of comorbidity argues for a comprehensive approach to intervention that identifies and evaluates each disorder concurrently, providing treatment as needed.<sup>4</sup>

The majority of adults who live with a mental health disorder do not get corresponding treatment. Furthermore, less than one-third of adults get minimally adequate care.<sup>5</sup> Stigma surrounding the receipt of mental health care is among the many barriers that discourage people from seeking treatment.<sup>6</sup> In addition, increasing physical activity and reducing obesity are also known to improve mental health.<sup>7</sup>

Therefore, our aim is to work with our community to reduce the stigma around seeking mental health treatment, to improve access to behavioral health services, increase physical activity, and reduce obesity especially for our most affected populations.

#### **Affected Populations:**

People with lower incomes are about three and a half times more likely to have depressive disorders.<sup>8</sup> Illicit drug use is significantly higher among males less than 34 years old, the unemployed, and those with incomes of less than \$50,000 annually.<sup>9</sup>

<sup>9</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

## Significant Health Need #2: Improve the Prevention and Management of Obesity

Our CHNA prioritization process identified prevention and management of obesity as one of our community's most significant health needs. Over 50% of the adults in our community are now obese or overweight. According to the Centers for Disease Control (CDC): "Obesity is a national epidemic and a major contributor to some of the leading causes of death in the United States." Obesity costs the United States about \$150 billion a year, or 10 percent of the national medical budget.<sup>10</sup>

### Impact on Community

Reducing obesity will dramatically impact community health by providing an immediate and positive effect on many conditions including mental health; heart disease; some types of cancer; high blood pressure; dyslipidemia; kidney, liver and gallbladder disease; sleep apnea and respiratory problems; osteoarthritis; and gynecological problems (infertility and abnormal menses).

---

<sup>10</sup> <http://www.cdc.gov/cdctv/diseaseandconditions/lifestyle/obesity-epidemic.html>

### **How to Address the Need**

Obesity can be prevented and managed by engaging our community in developing services and policies designed to encourage proper nutrition and healthy exercise habits. Obesity can also be managed through evidence-based clinical programs.<sup>11</sup>

Extremely promising outcomes are now being reported in some communities. Remarkably, from 2011 through 2014, Lee County, Florida, reduced adult obesity levels from 29.3% to 24.8% and childhood obesity dropped from 31.6% to 20.7%. These results were accomplished through extensive community leadership and involvement. A Lee Memorial Hospital representative commented: “We believe these improvements can be sustained and improved further.”<sup>12</sup> Echoing this approach, the CDC states that “we need to change our communities into places that strongly support healthy eating and active living.”<sup>13</sup>

### **Affected Populations**

Some populations are more affected by these health needs than others. For example, low income individuals and those without college degrees have significantly higher rates of obesity.

<sup>13</sup> <http://www.cdc.gov/cdctv/diseaseandconditions/lifestyle/obesity-epidemic.html>

### Significant Health Need #3: Improve Access to Affordable Health Insurance

Barriers to access are issues that prevent people from receiving timely medical care. They include things such as the lack of transportation to doctors' appointments, the availability of health care providers, and the cost of care. Our CHNA process identified the following high ranking barrier to access:

- Affordable health insurance

The health indicator data and community representative scores have ranked this barrier to access as one of our community's most significant health needs. A recent study showed that nearly 19 percent of U.S. adults do not receive medical care or delay medical care because they are concerned about the cost or worried that their health insurance would not pay for treatment.<sup>14</sup>

#### **Impact on community:**

Improving access to affordable health insurance can make a remarkable difference to community health. According to the Gallup-Healthways Well-Being Index, Americans in poverty are significantly more likely than those who are not to struggle with a wide array of chronic mental and physical health problems.<sup>15</sup> Further, evidence shows that uninsured individuals experience more adverse outcomes (physically, mentally, and financially) than insured individuals. The uninsured are less likely to receive preventive and diagnostic health care services, are more often diagnosed at a later disease stage, and on average receive less treatment for their condition compared to insured individuals. At the individual level, self-reported health status and overall productivity are lower for the uninsured. The Institute of

<sup>15</sup> <http://www.gallup.com/poll/158417/poverty-comes-depression-illness.aspx>

Medicine reports that the uninsured population has a 25% higher mortality rate than the insured population.<sup>16</sup>

**How to Address the Need:**

We will work with our community to improve access to affordable health insurance options.

**Affected populations:**

Statistics show that people with lower income and education levels and Hispanic populations are much more likely not to have health insurance.<sup>17</sup>

## **Other Health Needs**

Our full CHNA provides a ranked list of all the health needs we identified through our CHNA process along with representative feedback, trend, severity, and preventative information pertaining to the health needs.

## **Next Steps**

The main body of this CHNA provides more in-depth information describing our community's health as well as how we can make improvements to it. St. Luke's will collaborate with the people, leaders, and organizations in our community to develop and execute on an implementation plan designed to address the significant community health needs identified in this assessment. Utilizing effective, evidence-based programs and policies, we will work together toward the goal of attaining the healthiest community possible.

# St. Luke's Wood River Overview

## Background

In 1996, St. Luke's Medical Center of Boise was invited to oversee the construction and future operations of a new hospital in the Wood River Valley. Three years later, thanks to the overwhelming support of St. Luke's, registered voters and community philanthropists, a new \$32 million, 110,00 square foot hospital was constructed.

In November 2000, St. Luke's Wood River Medical Center opened its doors to serve the health care needs of people living in the greater Blaine County area. During the design process, special care was taken to ensure a facility that would complement the surrounding terrain, with the hospital's exterior and interior reflecting the beauty of Idaho's world-renowned Sun Valley area. To best accommodate the needs of the people in this region, the hospital site was located immediately off Highway 75.

Services at Wood River Medical Center include a 24-hour emergency department, inpatient and outpatient surgery, diagnostics, maternity services, physical and occupational therapy, mammography, orthopedics, intensive care and medical/surgical units. St. Luke's Center for Community Health's main office can be found in the neighboring town of Hailey, Idaho.

Known for our clinical excellence, St. Luke's Wood River has been nationally recognized for quality and patient safety, and we are proud to be in the top 10% of hospitals nationwide for our patient satisfaction score. We are also proud to be on the Magnet designation journey which would make us the second critical access hospital in the state to achieve such the designation.

St. Luke's Wood River is part of the St. Luke's Health System (SLHS). Today SLHS is the only locally governed, Idaho-based, not-for-profit health system, with a network of six separately licensed full service medical centers and more than 100 outpatient centers and clinics serving people throughout southern Idaho, eastern Oregon, and northern Nevada.

St. Luke's Wood River is fortunate to have over 250 volunteers, more than 50 physicians on the medical staff, and a dedicated governing board comprised of independent civic leaders who volunteer their time to serve.

## Mission, Vision, and Core Values

All St. Luke’s medical centers and clinics are committed to our overall mission, vision, and values.

Our mission is “To improve the health of people in our region.”

Our vision is to “Transform health care by aligning with physicians and other providers to deliver integrated, seamless, and patient-centered quality care across all St. Luke’s settings.”

Our core values are:

Integrity

Compassion

Accountability

Respect

Excellence

## Governance Structure

Each St. Luke’s medical center is responsive to the people it serves, providing a scope of service appropriate to community needs. Because leaders from within the community have the best insight into the needs of their own families, friends, and neighbors, local control is one of the tenets of St. Luke’s.

Local boards have oversight over their business affairs and have decision-making authority. Our volunteer boards include representatives from each St. Luke’s service area, helping to ensure local needs and interests are addressed.

## The Community We Serve

This section describes our community in terms of its geography and demographics. Blaine County represents the geographic area used to define the community we serve also referred to here as our primary service area or service area. The criteria we use in selecting this area as the community we serve was to include the entire population of the counties where approximately 70% of our inpatients reside. The residents of Blaine County comprise about 70% of our inpatients. Blaine County is part of Idaho Health District 5, as shown in the maps below.

Idaho Health District Map <sup>18</sup>

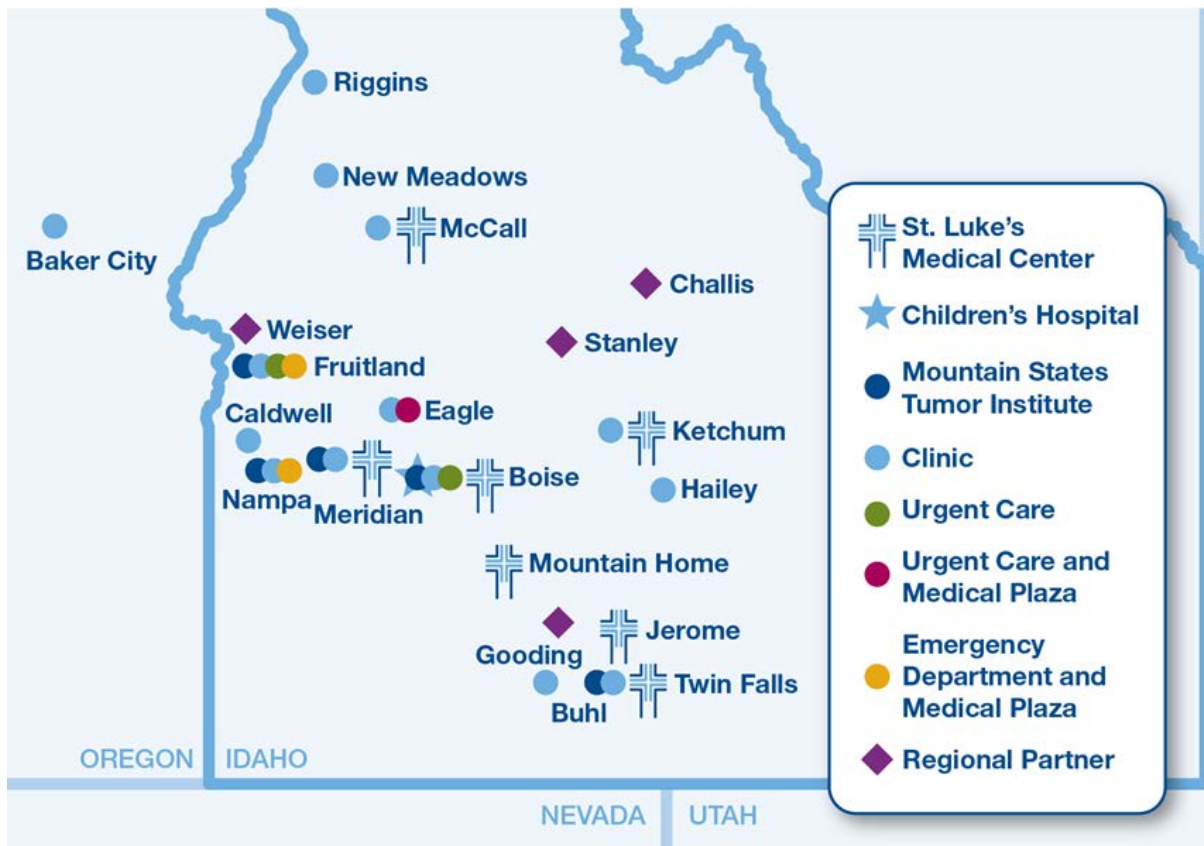

Blaine County Map

<sup>18</sup> Idaho Behavioral Risk Factor Surveillance System Annual Report 2012

Our patients in the surrounding counties of southwestern Idaho and eastern Oregon are important to us as well. To help us serve these patients, we have built positive, collaborative relationships with regional providers where legal and appropriate. A philosophy of shared responsibility for the patient has been instrumental in past successes and remains critical to the future of St. Luke's. Partnerships, such as those shown below, allow us to meet patients' medical needs close to home and family.

### St. Luke's Regional Relationships Map

## Community Demographics

The demographic makeup of our nation, state, and service area populations are provided in the table below. This information helps us understand the size of various populations and possible areas of community need. Our goal is to reduce disparities in health care access and quality due to income, education, race, or ethnicity.

Both Idaho and our service territory are comprised of about a 95% white population while the nation as a whole is 78% white. The Hispanic population in Idaho represents 12% of the overall population and about 20% of our defined service area.

### Population by Race and Ethnicity 2013<sup>19</sup>

Residence	Total Population	Race				Ethnicity	
		White	Black	American Indian	Asian or Pacific Islander	Not Hispanic or Latino	Hispanic or Latino
<b>Blaine County</b>	21,329	20,600	136	318	275	17,049	4,280
		97%	1%	1%	1%	80%	20%
<b>Idaho</b>	1,612,136	1,533,351	18,002	31,792	28,991	1,421,886	190,250
		95%	1%	2%	2%	88%	12%
<b>National (000)</b>	316,129	245,499	41,624	3,910	17,354	262,057	54,071
		78%	13%	1%	5%	83%	17%

<sup>19</sup> Bureau of Vital Records and Health Statistics, Idaho Department of Health and Welfare (1/2015). The bridged-race population estimates were produced by the Population Estimates Program of the U.S. Census Bureau in collaboration with the National Center for Health Statistics (NCHS). Internet release date March 17, 2015.

## Population Growth 2000-2013

Idaho experienced a 25% increase in population from 2000 to 2013, ranking it as one of fastest growing states in the country.<sup>20</sup> Blaine County’s population increased by 12% during that timeframe, which is about the same population growth rate as the nation.<sup>21</sup> St. Luke’s Wood River is working to manage the volume and scope of services in order to meet the needs of a growing population.

Region	Population April 2000	Population April 2013	Percent Change
Service Area	18,991	21,329	12%
Idaho	1,293,953	1,612,136	25%
United States	281,421,906	316,129,839	12%

## Aging

Over the past ten years the 45 year or older age group was the fastest growing segment of our community. Currently, about 13% of the people in our community are over the age of 65.<sup>22</sup>

Year	Population by Age			
	Age 0-19	Age 20-44	Age 45-64	Age 65+
2000	5,077	8,289	4,269	1,482
Percent of total	27%	43%	22%	8%
2013	5,345	6,484	6,741	2,724
Percent of total	25%	30%	32%	13%

<sup>20</sup> U.S. Census Bureau: <http://quickfacts.census.gov/qfd/index.html> 2013

<sup>21</sup> Idaho Vital Statistics County Profile 2013

<sup>22</sup> Ibid

## Poverty Levels

The official United States poverty rate increased from 12.5% in 2003 to 15.6% in 2013. Our service area poverty rate is well below the national average. The poverty rate in our community for children under the age of 18 is also lower than the national average. Although poverty has started declining in our service area, poverty rates are still above the levels they were at prior to the recession in 2008.<sup>23</sup>

<sup>23</sup> Small Area Income and Poverty Estimates (SAIPE)  
<http://www.census.gov/did/www/saipe/data/statecounty/data/index.html>

## Median Household Income

Median income in the United States has risen by 20% since 2003 and by 29% in our service area during that period. Median income in our service area is well above national and Idaho median income levels.<sup>24</sup>

<sup>24</sup> Ibid

## Community Health Needs Assessment Methodology

St. Luke's 2016 Community Health Needs Assessment (CHNA) is designed to help us better understand and meet our most significant community health challenges. The methodology used to accomplish this goal is described below.

The first step in our process for defining community health needs is to understand the health status of our community. **Health outcomes** help us determine overall health status. Health outcomes include measures of how long people live, how healthy people feel, rates of chronic disease, and the top causes of death. While measuring health outcomes is critical to understanding health status, defining health factors is essential to improving health. **Health factors** are key influencers of health outcomes. Examples of health factors are nutritional habits, exercise, substance abuse, and childhood immunizations.

Once we understand our community health outcomes and the factors that influence them, we use this information to define our community health needs. **Community health needs** are the *programs, services, and policies needed to positively impact* health outcomes and their related health factors. St. Luke's views the fulfillment of our health needs as an essential opportunity to achieve improved population health, better patient care, and lower overall cost.

In our CHNA, we divide our health needs into four distinct categories: 1) health behaviors; 2) clinical care; 3) social and economic factors; and 4) physical environment. Each identified health need is included in one of these categories.

Our health needs, factors, and outcomes are identified and measured through the analysis of a broad range of research including:

1. The **County Health Rankings** methodology for measuring community health. The University of Wisconsin Population Health Institute, in collaboration with the Robert Wood Johnson Foundation, developed the *County Health Rankings*. The *County Health Rankings* provides a thoroughly researched process for selecting health factors that, if improved, can help make our community a healthier place to live. A detailed description of their recommended health outcomes and factors is provided in the following sections of our CHNA.
2. Building on the *County Health Rankings* measures, **we gather a wide range of additional community health outcome and health factor measures** from national, state, and local perspectives. We include these supplemental measures in our CHNA to ensure a comprehensive appraisal of the underlying causes of our community's most pressing health issues.
3. Community input is at the center of our CHNA process. In-depth **interviews are conducted with a diverse group of representatives** possessing extensive knowledge of

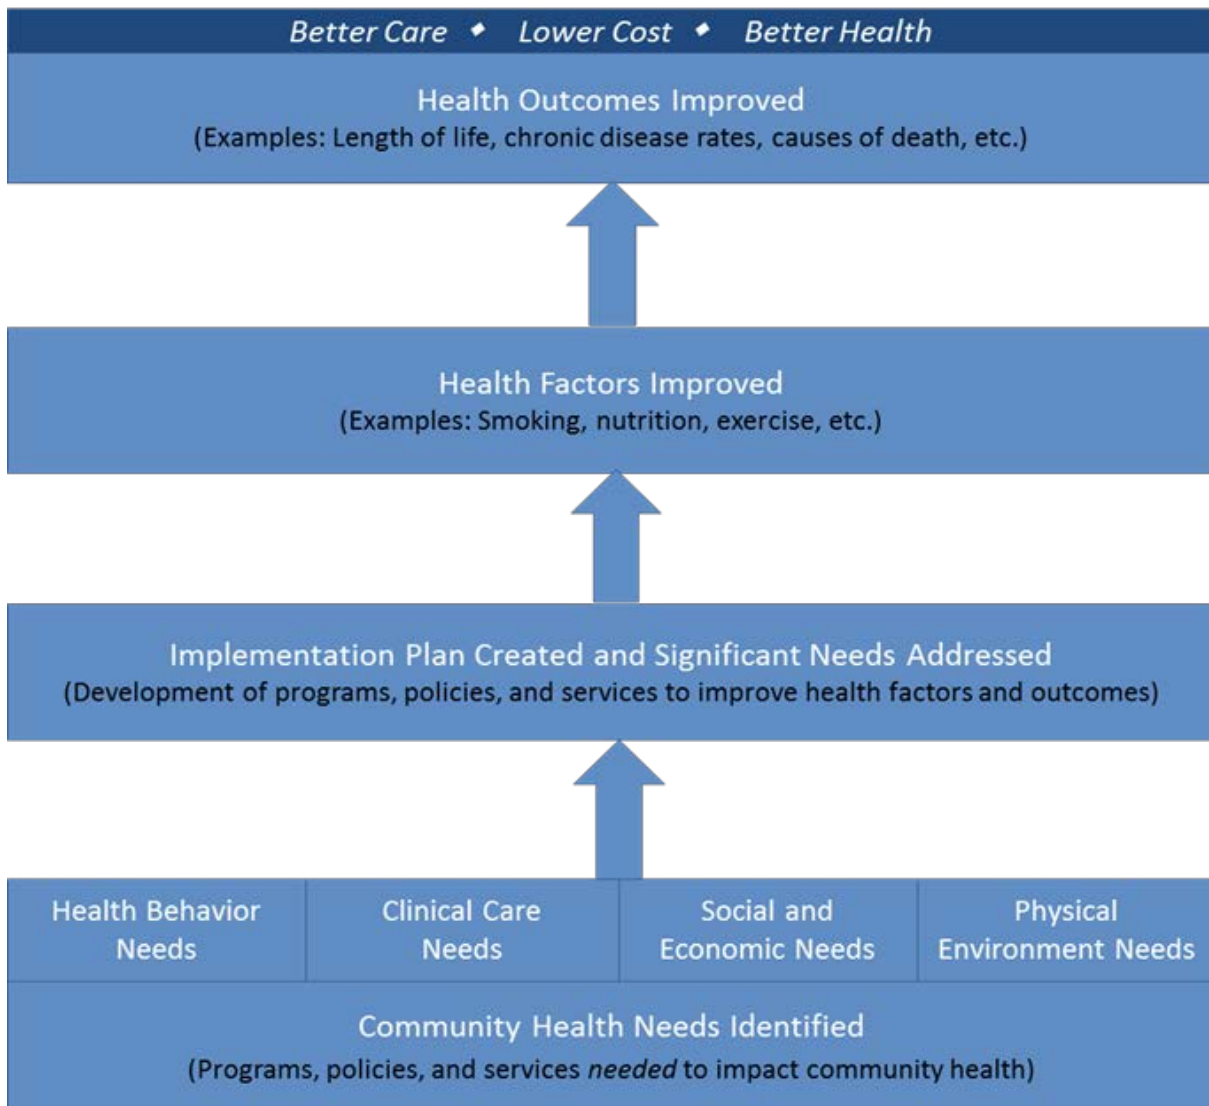

community health and wellness. Our community representatives help us define our most important health needs and provide valuable input on programs and legislation they feel would be effective in addressing the needs.

4. Finally, we employ a rigorous prioritization system designed to identify and rank our most impactful health needs, incorporating input from our community health representatives as well as the secondary research data collected on each health outcome and factor.

The chart below provides a graphical summary of the approach used to develop our CHNA.

### St. Luke's Approach to Improving Community Health

## Health Outcome and Health Factor Research Scoring System

As described in the previous section, an important part of our CHNA methodology involves incorporating an objective way to measure each health outcome and factor’s potential to impact community health. This section provides additional detail on how we accomplish this.

- Each health outcome or factor receives a **trend** score from 0 to 4, based on whether the measured value is getting better or worse compared to previous years. If the trend is getting worse, community health may be improved by understanding the underlying causes for the worsening trend and addressing those causes.
- A **prevalence** score from 0 to 4 is assigned based on whether the community’s health outcome is better or worse than the national average. The worse the community health outcome is relative to the national average, the higher the assigned value because there is more room for improvement.
- The **severity** of the health outcome or factor is scored from 0 to 4 based on the direct influence it has on general health and whether it can be prevented. Therefore, leading causes of death or debilitating conditions receive high severity scores when the health problem is preventable. For example, there are few evidence-based ways to prevent pancreatic cancer. Since little can be done to prevent this health concern, its severity score potential is not as high as the severity score for a condition such as diabetes which has many evidence-based prevention programs available.
- The **magnitude** of the health outcome or factor is scored from 0 to 4 based on whether the problem is a root cause or contributing factor to other health problems. The magnitude score is the highest when the health outcome or factor is also manageable or can be controlled. For example, obesity is a root cause of a number of other health problems such as diabetes, heart disease, and high blood pressure. Obesity may also be controlled through diet and exercise. Consequently, obesity has the potential for a high point score for “magnitude.”

The scores for the four measures defined above are totaled up for each health outcome and factor – the higher the total score, the higher the potential impact on the health of our population. These scores are utilized as an important part of our prioritization process. Tables like the example, below, are used to score each health outcome and factor.

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
Health Factor Name	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Example factor	0 to 4 points	0 to 4 points	0 to 4 points	0 to 4 points	0 to 16 points

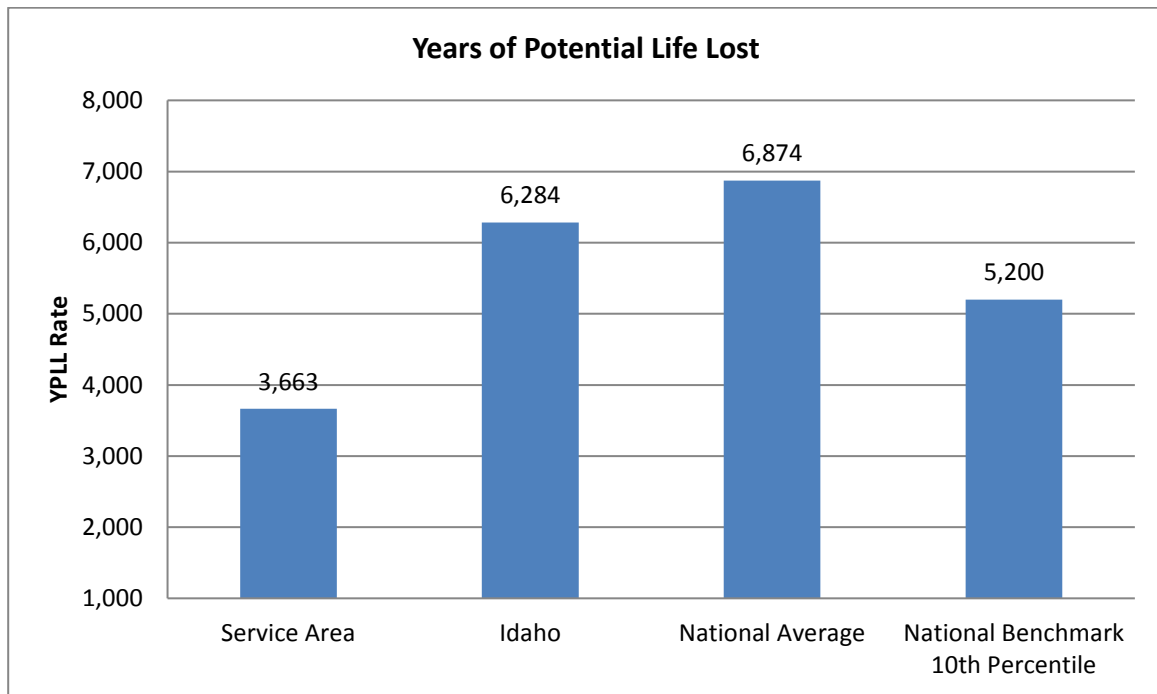

## Health Outcome Measures and Findings

Health outcomes represent a set of key measures that describe the health status of a population. These measures allow us to compare our community's health to that of the nation as a whole and determine whether our health improvement programs are positively affecting our community's health over time. The health outcomes recommended by the *County Health Rankings* are based on one length of life measure (mortality) and a number of quality of life measures (morbidity).

### Mortality Measure

- **Length of Life Measure: Years of Potential Life Lost**

The length of life measure, Years of Potential Life Lost (YPLL), focuses on deaths that could have been prevented. YPLL is a measure of premature death based on all deaths occurring before the age of 75. By examining premature mortality rates across communities and investigating the underlying causes of high rates of premature death, resources can be targeted toward strategies that will extend years of life.

The chart above shows our service area YPLL for 2013 is much lower than the national average. This is an excellent outcome indicating that on average people in our service area are not dying prematurely.<sup>25</sup>

<sup>25</sup> Bureau of Vital Records and Health Statistics, Idaho Department of Health and Welfare (1/2015) (Idaho and county data)

## Morbidity Measures

Morbidity is a term that refers to how healthy people feel while alive. To measure morbidity, the *County Health Rankings* recommends the use of the population’s health-related quality of life defined as people’s overall health, physical health, and mental health. They also recommend the use of birth outcomes – in this case, babies born with a low birth weight. The reasons for using these measures and the specific outcome data for our community are described below.

### Health Related Quality of Life (HRQOL)

Understanding the health related quality of life of the population helps communities identify unmet health needs. Three measures from the CDC’s Behavioral Risk Factor Surveillance System (BRFSS) are used to define health-related quality of life: 1) The percent of adults reporting fair or poor health, 2) the average number of physically unhealthy days reported per month, and 3) the number of mentally unhealthy days reported per month.

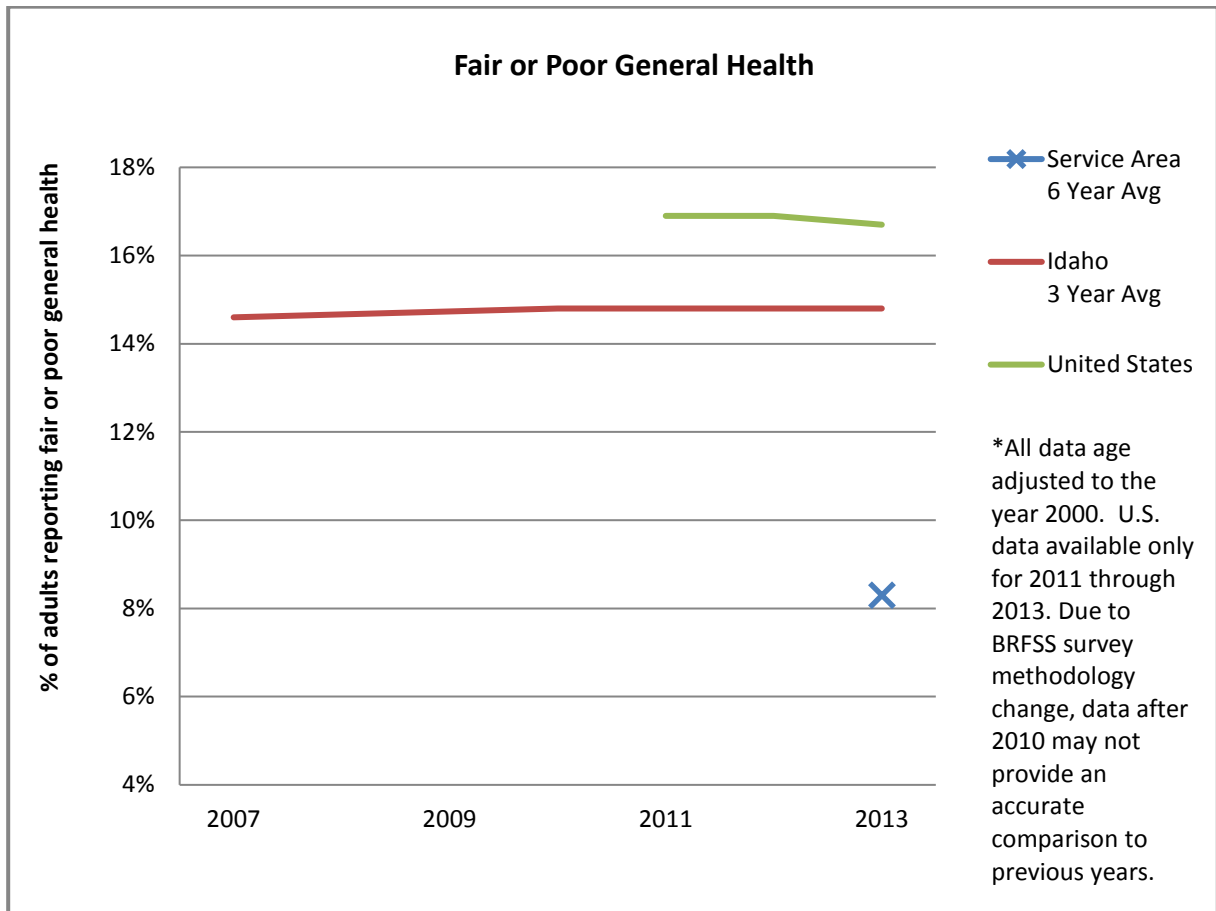

Researchers have consistently found self-reported general, physical, and mental health measures to be informative in determining overall health status. Analysis of the association between mortality and self-rated health found that people with “poor” self-rated health had a twofold higher mortality risk compared with persons with “excellent” self-rated health. The analysis concludes that these measures are appropriate for measuring health among large populations.<sup>26</sup>

---

<sup>26</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

- **"Fair or Poor" General Health**

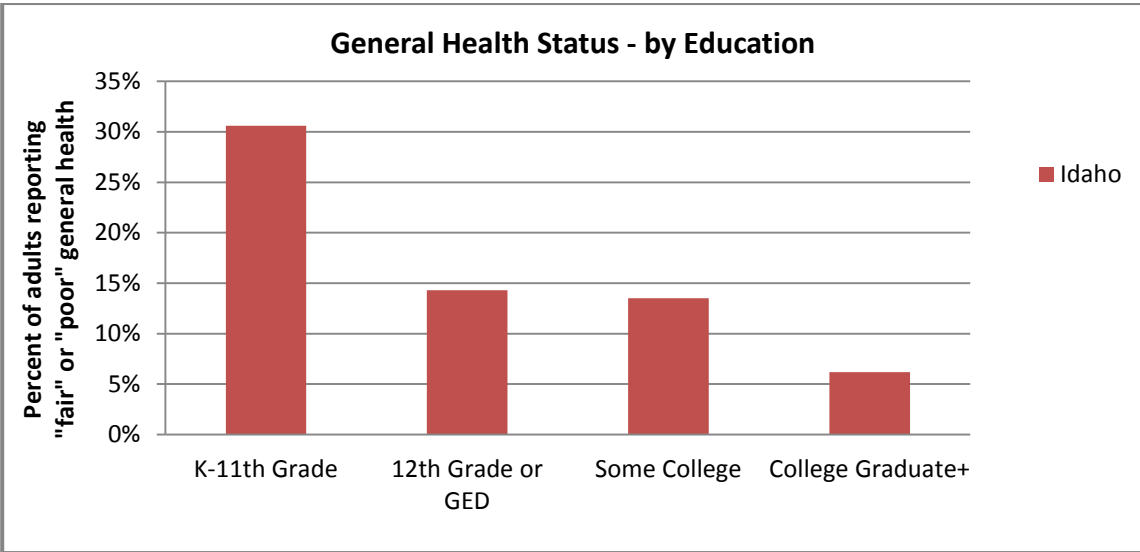

Fourteen point eight percent (14.8%) of Idaho adults reported their health status as fair or poor in 2013, which is approximately the same as in 2007. For our service area, the percent of people reporting fair or poor health is about 8.3% in 2013, which is in the top 10<sup>th</sup> percentile nationally.<sup>27</sup> The national top 10<sup>th</sup> percentile (best) is 10% or less.<sup>28</sup>

The charts below show that income and education greatly affect the levels of reported fair or poor general health. For example, people with incomes of less than \$15,000 are seven times more likely to report fair or poor general health than those with incomes above \$75,000. In addition, Hispanics are significantly more likely to report fair or poor health than non-Hispanics.

<sup>27</sup> Idaho and National 2004 - 2013 Behavioral Risk Factor Surveillance System

<sup>28</sup> *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

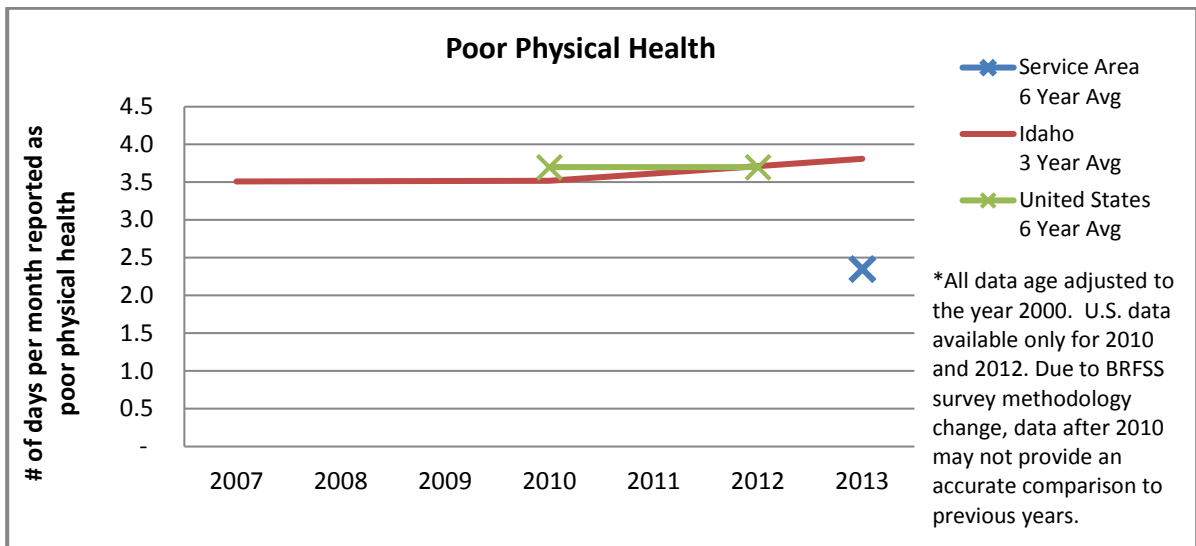

- **Poor Physical Health Days**

The number of reported poor physical health days for our service area is 2.35 days, which is in the national top 10<sup>th</sup> percentile nationally.<sup>29</sup> The national top 10<sup>th</sup> percentile is 2.5 days.<sup>30</sup>

- **Poor Mental Health Days**

The number of poor mental health days for our service area is 2.06 days, which is in the national top 10<sup>th</sup> percentile nationally.<sup>31</sup> The national top 10<sup>th</sup> percentile is 2.5 days.<sup>32</sup>

<sup>29</sup> Idaho 2013 Behavioral Risk Factor Surveillance System

<sup>30</sup> County Health Rankings 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>31</sup> Idaho 2013 Behavioral Risk Factor Surveillance System

<sup>32</sup> County Health Rankings 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

- **Low Birth Weight**

Low birth weight (LBW) is unique as a health outcome because it represents two factors: maternal exposure to health risks and the infant’s current and future morbidity, as well as premature mortality risk. The health associations and impacts of LBW are numerous.<sup>33</sup>

The percent of LBW babies in our service area and in Idaho is approximately the same as the national average and the trend has been getting worse.<sup>34</sup> This is a key indicator of future health. The national top 10<sup>th</sup> percentile for LBW is 6.0%.

Low birth weight can be addressed in multiple ways, including:<sup>35</sup>

- Expanding access to prenatal care and dental services
- Focusing intensively on smoking prevention and cessation
- Ensuring that pregnant women get adequate nutrition
- Addressing demographic, social, and environmental risk factors

Health Factor Score

## ***County Health Rankings Health Outcomes Ranking for Our Community***

The *County Health Rankings* ranks the counties within each state on the health outcome measures described above. Blaine County's 2015 overall outcome rank is 2nd out of a total of 42 counties in Idaho.<sup>36</sup> Using the health factor and health needs information described later in our CHNA, programs will be developed to improve health outcome measures over the course of the next three years.

---

<sup>36</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org)

## **Additional Health Outcome Measures and Findings**

In addition to the *County Health Ranking* general outcome measures, we collected a set of community health outcomes measures from national, state, and local perspectives to create a more specific set of health indicators and measures for our community.

The health outcome measures provided below include information on chronic disease prevalence and the top 10 causes of death. These outcomes help identify the underlying reasons why people in our community are dying or are in poor health. Knowing the trend, prevalence, severity, and magnitude of common chronic diseases and the top causes of death can assist us in determining what kind of preventive and early diagnosis programs are most needed or where adding health care providers would have the greatest impact on health.

### **Chronic Disease Prevalence**

Chronic disease prevalence provides insights into the underlying reasons for poor mental and physical health. Many of these diseases are preventable or can be treated more effectively if detected early. Consequently, we added measurement and trend data on the following chronic conditions: AIDS, arthritis, asthma, diabetes, high blood pressure, high cholesterol, and mental illness.

- **AIDS**

The AIDS rate in Idaho is well below the national rate.<sup>37</sup> The trend in Idaho has been relatively flat from 2004 to 2013.<sup>38</sup>

African Americans are more likely to have HIV than any other racial/ethnic group in the United States (US). In 2010, African Americans accounted for 44% of new HIV infections while representing only 12% of the population. In 2010, African American men accounted for 70% of the estimated new HIV infections among all African Americans.<sup>39</sup> Young people in the US are also more at risk for HIV infection accounting for 26% of all new HIV infections in 2010. This risk is particularly high for young, gay, bisexual, and other men who have sex with men (MSM). HIV prevention programs, including education on abstinence and safe sex, will be helpful to younger people who did not benefit from the outreach conducted in the 1980s and 1990s.<sup>40</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score

<sup>39</sup> <http://www.cdc.gov/HIV/TOPICS/>

<sup>40</sup> <http://www.cdc.gov/hiv/youth/>

- **Arthritis**

In 2010, 24.1 % of Idaho adults had ever been told by a medical professional that they had arthritis. The prevalence of arthritis in our service area is well below the national average and has not changed significantly since 2005.

The majority of those with arthritis (54.5%) reported that their activities were limited due to health problems. The likelihood of having arthritis increases with age. More than half of those surveyed ages 65 and older had been diagnosed with arthritis.

Other Highlights:

- Idaho residents with incomes below \$50,000 per year were more likely to have arthritis than those with incomes of \$50,000 or higher (25% compared with 18.7%).
- Hispanics were significantly less likely than non-Hispanics to have been diagnosed with arthritis (14.5% compared with 23.8%).
- Overweight adults (BMI  $\geq$  25) were more likely to have arthritis compared to those who were not overweight.<sup>41</sup>

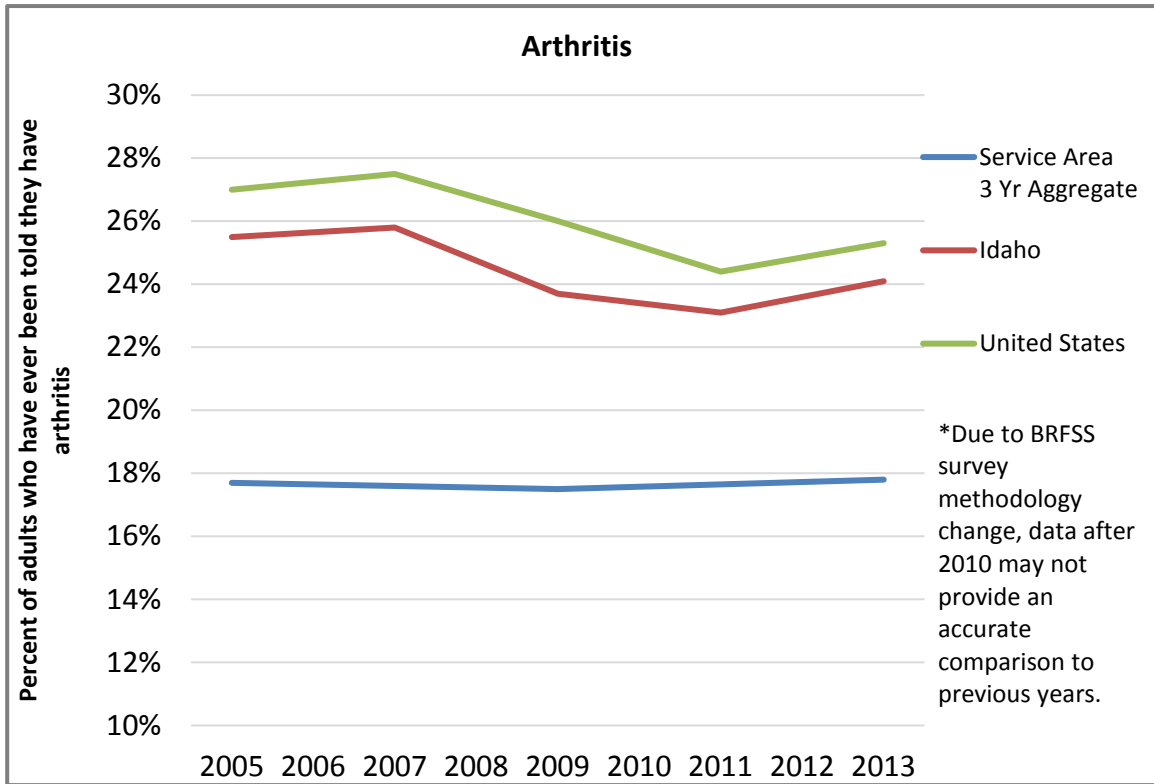

Some types of arthritis can be treated and possibly prevented by making healthy lifestyle choices. Common tips for prevention and treatment include:

- Maintain recommended weight. Women who are overweight have a higher risk of developing osteoarthritis in the knees.
- Regular exercise can help by strengthening muscles around joints and increasing bone density.
- Avoid smoking and limit alcohol consumption to help avoid osteoporosis. Both habits weaken the structure of bone increasing the risk of fractures.<sup>42</sup>

---

<sup>41</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>42</sup> Arthritis Foundation, <http://www.arthritis.org/preventing-arthritis.php>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Arthritis	2	0	2	0	4

- **Asthma**

The percentage of people with asthma in our service area is lower than the national average. Thirty percent (30%) of adults with current asthma reported their general health status as “fair” or “poor,” which is more than twice as high as people who did not have asthma (only 13.7% of people without asthma reported fair or poor health). Females, unemployed, and non-college graduates are more likely to have current asthma.<sup>43</sup>

Asthma is a long-term disease that can't be cured or prevented. The goal of asthma treatment is to control the disease. To control asthma, it is recommended that people partner with their provider to create an action plan that avoids asthma triggers and includes guidance on when to take medications or to seek emergency care.<sup>44</sup>

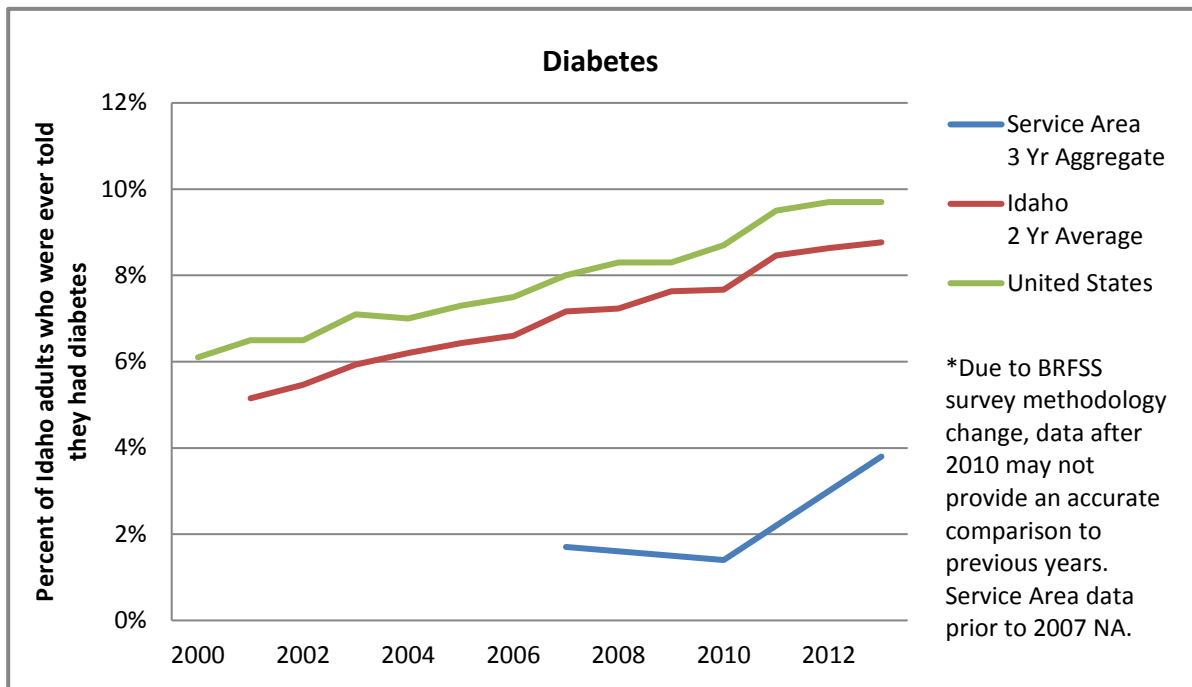

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>44</sup> [http://www.nhlbi.nih.gov/health//dci/Diseases/Asthma/Asthma\\_Treatments.html](http://www.nhlbi.nih.gov/health//dci/Diseases/Asthma/Asthma_Treatments.html)

- **Diabetes**

About 3.8% of the people in our community report that they have been told they have diabetes. The percent of people living with diabetes in our service area and in the United States is up by about 50% over the past ten years, indicating an opportunity for greater focus on prevention. Diabetes is a serious health issue that can contribute to heart disease, stroke, high blood pressure, kidney disease, blindness and can even result in limb amputation or death.<sup>45</sup> Direct medical costs for type 2 diabetes exceed \$100 billion and account for \$1 of every \$10 spent on medical care in the U.S.<sup>46</sup>

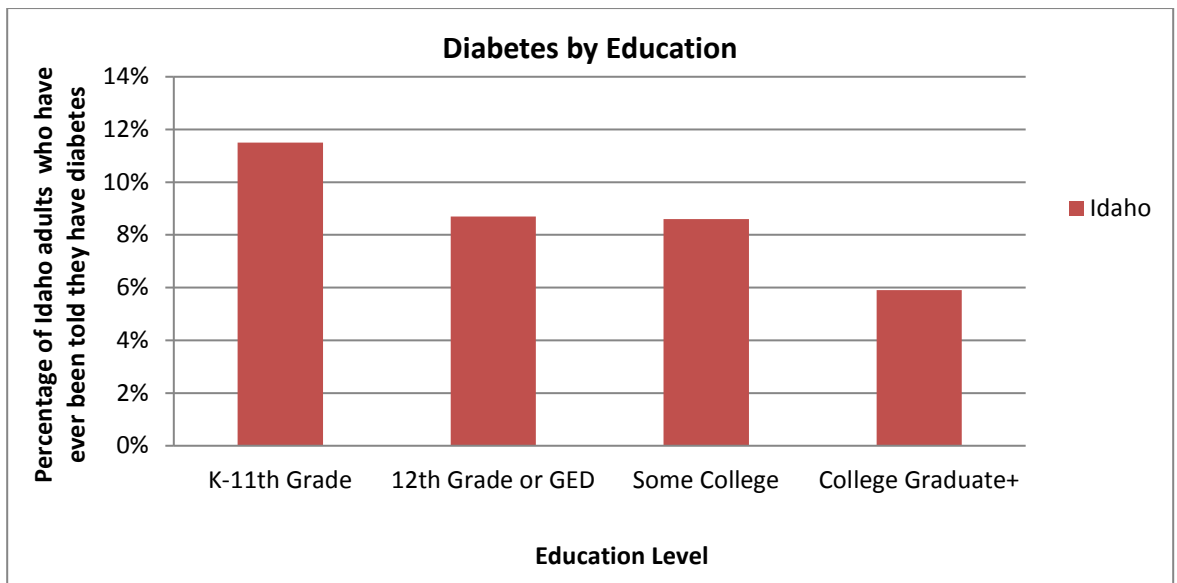

Other Highlights:

- Overweight (BMI  $\geq$  25) adults reported diabetes more than three times as often as those who were not overweight. Among overweight adults, 10.6% had diabetes compared with 3.4% of those who were not overweight or obese.
- Those who did not engage in leisure time physical activity reported diabetes more than twice as often as those who did have leisure time physical activity.
- Those with a high school diploma or less education were significantly more likely to have diabetes than college graduates.
- Those with lower incomes were more likely to have diabetes than those with mid-level or high incomes.<sup>47</sup>

<sup>45</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>46</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

<sup>47</sup> Ibid.

Studies indicate that the onset of type 2 diabetes can be prevented through weight loss, increased physical activity, and improving dietary choices. Diabetes can be managed through regular monitoring, following a physician-prescribed care regiment, adjusting diet, and maintaining a physically active lifestyle.<sup>48</sup>

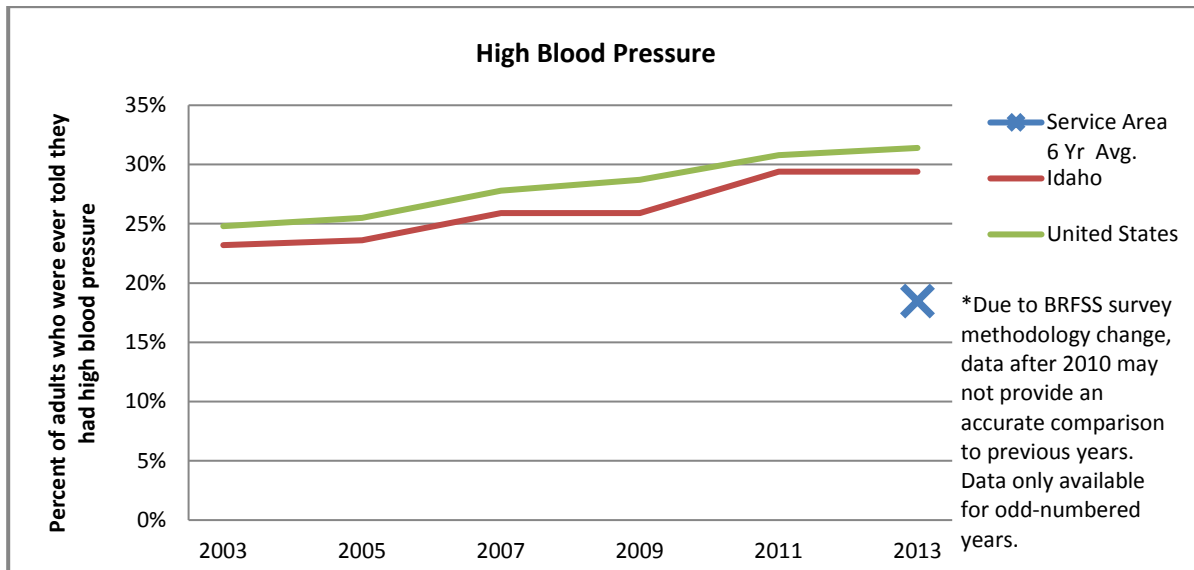

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score

<sup>48</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

- **High Blood Pressure**

The incidence of high blood pressure in the United States has continued to rise steadily over time. Currently, about one in every three Americans suffers from high blood pressure. Blood pressure rates in our service area are significantly below the national level. High blood pressure is a major risk factor for heart disease, stroke, congestive heart failure, and kidney disease.<sup>49</sup>

- Those with incomes below \$35,000 per year were significantly more likely to have been told they had high blood pressure than those with annual incomes of \$50,000 or more.
- Those who were overweight (BMI > 25) reported having high blood pressure twice as often as those who were not overweight (BMI < 25).
- Adults who had been told they had high blood pressure were significantly more likely to have been told by a health professional that they also have angina or coronary heart disease.<sup>50</sup>

Healthy blood pressure may be maintained by changing lifestyle or combining lifestyle changes with prescribed medications.<sup>51</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>50</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>51</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

- **High Cholesterol**

Among those who had ever been screened for cholesterol in our service area, approximately 34% reported that they were told their cholesterol was high in 2013, which is below the national average. The percentage of screened adults with high cholesterol has stayed about the same in our service area since 2005. Sustained, increased cholesterol levels can lead to heart disease, heart attack, and other circulatory problems.<sup>52</sup>

Other Highlights:

- Prevalence of high cholesterol decreased with higher levels of education.
- Adults who had been screened and told they had high cholesterol reported their general health status as “fair” or “poor” significantly more often than those who had not been told they had high cholesterol.
- Those who were overweight were significantly more likely to have high cholesterol than those who were not overweight.
- Adults aged 55 and older were almost twice as likely to have had high blood cholesterol levels as those under age 55.<sup>53</sup>

While some factors that contribute to high cholesterol are out of our control, like family history, there are many things a person can do to keep cholesterol in check, such as

<sup>52</sup> Ibid.

<sup>53</sup> Idaho 2011 - 2013 Behavioral Risk Factor Surveillance System

following a healthy diet, maintaining a healthy weight, and being physically active. For some individuals, a physician-recommended pharmacological intervention may be necessary.<sup>54</sup>

<sup>54</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

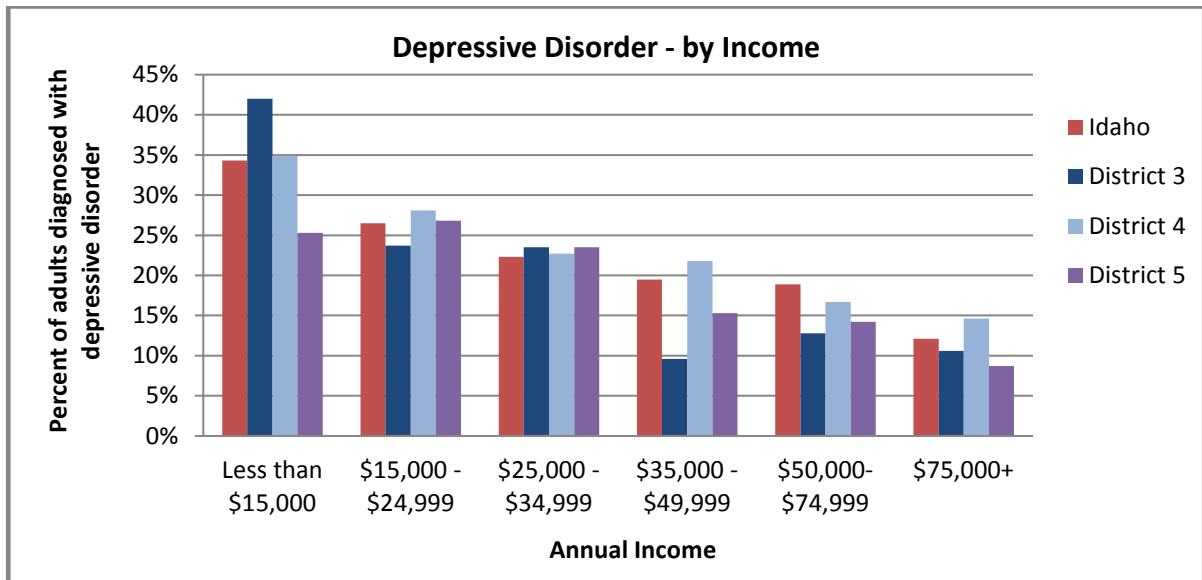

- **Mental Illness**

Community mental health status can help explain suicide rates as well as help us understand the need for mental health professionals in our service area. The percentage of people age 18 or older having any mental illness (AMI) (2009-2011 latest years available) was 23.3% for Idaho. This was the third highest percentage of mental illness in the nation. The percentage of people having any mental illness for the United States as a whole was 17.8%.<sup>55</sup>

<sup>55</sup> Mental Health, United States, 2012 Report, SAMHSA, [www.samhsa.gov](http://www.samhsa.gov)

The charts below show that people with lower incomes are about three and a half times more likely to have depressive disorders, and women are more likely than men to be diagnosed with a depressive disorder.<sup>56</sup>

<sup>56</sup> Idaho 2011 - 2013 Behavioral Risk Factor Surveillance System

## Top 10 Causes of Death

The top 10 causes of death can help identify opportunities to improve community health by comparing the local death rates and trends to the national average. The section below provides data and analysis for the top 10 causes of death for Idaho and our community.

- **Cancer (malignant neoplasms)**

Cancer is the leading cause of death in Idaho and the second leading cause of death in the United States. In Idaho, about one in two men and one in three women will be diagnosed with cancer sometime in their lives. About 22% of all deaths in Idaho each year are from cancer.

Although cancer may occur at any age, it is generally a disease of aging. Nearly 80% of cancers are diagnosed in persons 55 or older. Cancer is caused both by external factors such as tobacco use and exposure, chemicals, radiation and infectious organisms, and by internal factors such as genetics, hormonal factors, and immune conditions.

Cancer is among the most expensive conditions to treat. Many individuals face financial challenges because of lack of insurance or underinsurance, resulting in high out-of-pocket expenses.<sup>57</sup>

The chart below shows the cancer death rate in our service area is significantly below the national average. The trend for cancer deaths in our service area is relatively flat.<sup>58</sup>

---

<sup>57</sup> Comprehensive Cancer Alliance for Idaho, Idaho Comprehensive Cancer Strategic Plan 2004-2010, [www.ccaidaho.org](http://www.ccaidaho.org)

<sup>58</sup> Idaho Vital Statistics Annual Reports, Years 2003 - 2013, National Vital Statistics Report - Deaths: Data 2013

If tobacco use, poor diet, and physical inactivity were eliminated, the CDC estimates that 40% of cancers would be prevented. Therefore, opportunities exist to reduce the risk of developing some cancers.<sup>59</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Cancer	2	0	3	1	6

Although our service area's cancer rate is now below the national average, cancer is a term that includes more than 100 different diseases. Some cancer death rates may be relatively high in our service area, so we have collected data on the most common forms of cancer in Idaho below.

<sup>59</sup> America's Health Rankings 2011, [www.americashealthrankings.org](http://www.americashealthrankings.org)

- **Lung Cancer**

Lung cancer is the leading cause of cancer death in Idaho. However, the lung cancer death rate in our service area is below the national average.<sup>60</sup> Current science does not support population-based efforts to screen for lung cancer. More than 80% of lung cancers are a result of tobacco smoking.<sup>61</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Lung Cancer	1	0	4	1	6

<sup>61</sup> Comprehensive Cancer Alliance for Idaho, Idaho Comprehensive Cancer Strategic Plan 2004-2010, [www.ccaidaho.org](http://www.ccaidaho.org)

- **Colorectal Cancer**

In Idaho, colorectal cancer is the second most common cancer-related cause of death among males and females combined. The trend for colorectal cancer deaths in our service area flat over the past five years. The death rate is now about the same as the national average.<sup>62</sup> There is evidence that cancers of the colon are associated with obesity and that preventing weight gain can reduce the risk. Early detection is effective in reducing colorectal cancer death rate.<sup>63</sup>

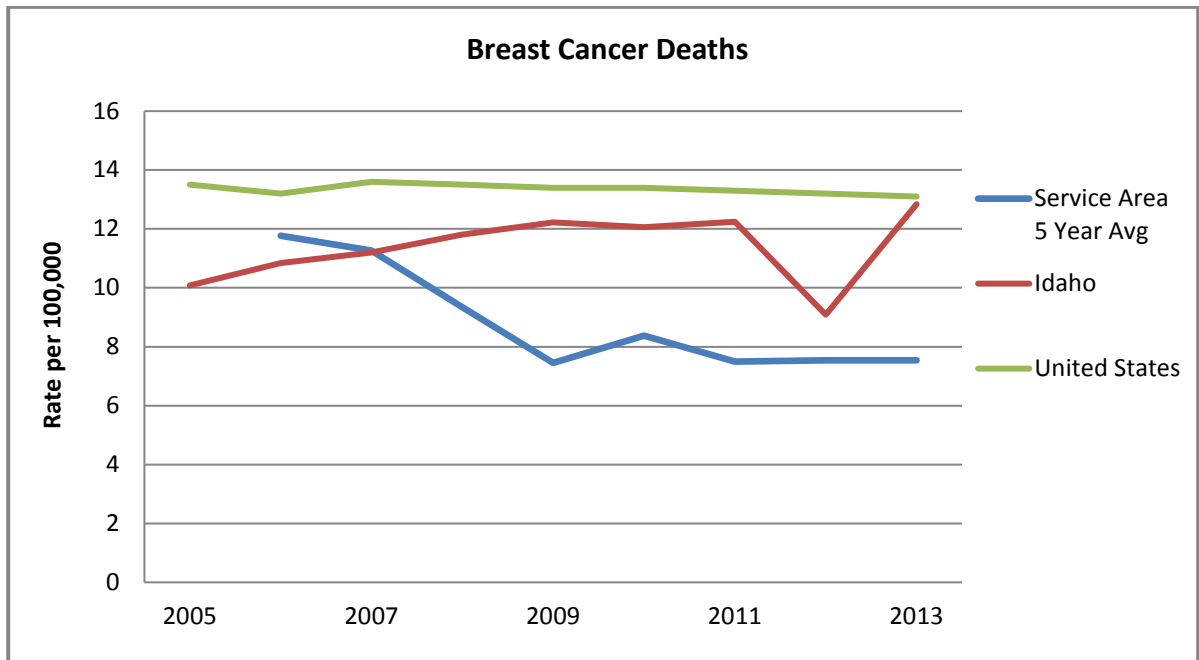

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude	Total Score
Colorectal Cancer	2	1	4	0	7

<sup>63</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

- **Breast Cancer**

Breast cancer is the second leading cause of cancer death, after lung cancer among Idaho women. The breast cancer death rate in our service area is much lower than the national average.<sup>64</sup> Although nationally breast cancer rates have continued to rise since 1980, there has been a decline in the death rate from breast cancer. Survival rates differ significantly by stage of diagnosis. For women under age 65, uninsured women have the highest rates of more advanced stages of breast cancer (48%) compared to those with private insurance (33%), Medicare (25%), and Medicaid (43%).<sup>65</sup>

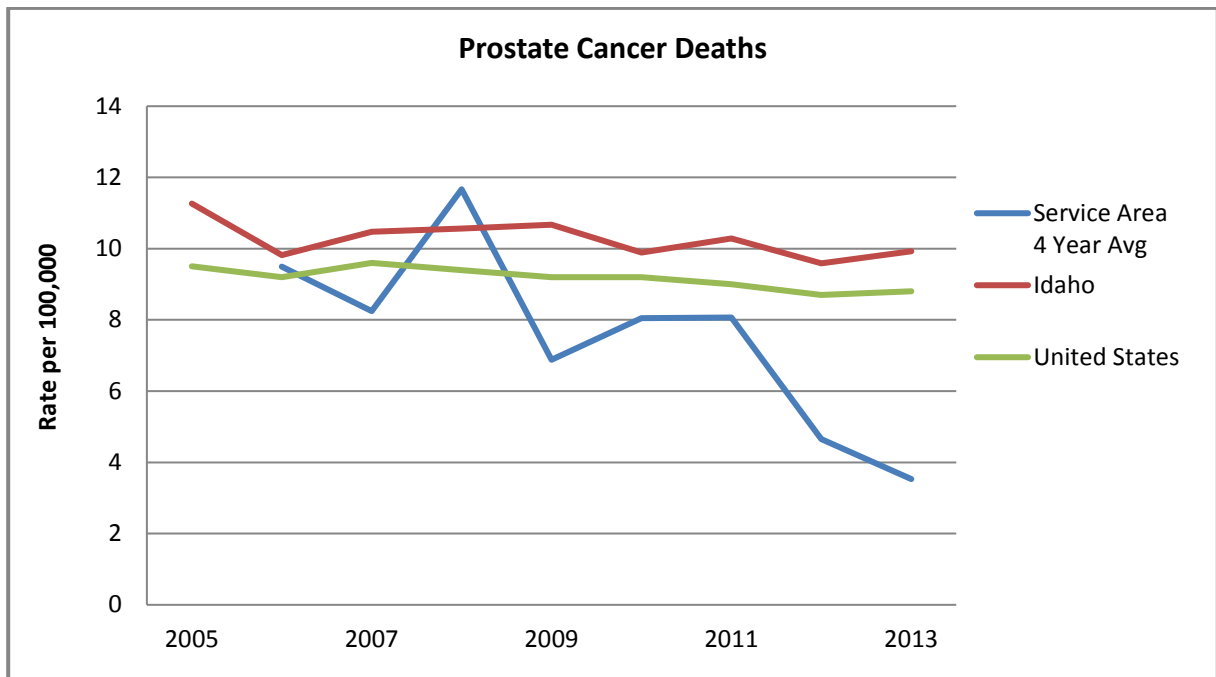

Health Factor Score

<sup>65</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

- **Prostate Cancer**

Prostate cancer is the second overall cause of death in Idaho men and is the most common cancer among males. In our service area, the prostate cancer rate is much lower than the national average.<sup>66</sup> Known risk factors for prostate cancer that are not modifiable include age, ethnicity, and family history. One modifiable risk factor is a diet high in saturated fat and low in vegetable and fruit consumption. While good evidence exists that prostate-specific antigen (PSA) screening along with digital rectal exam can detect early-stage prostate cancer, the evidence is inconclusive that early detection improves health outcomes.<sup>67</sup>

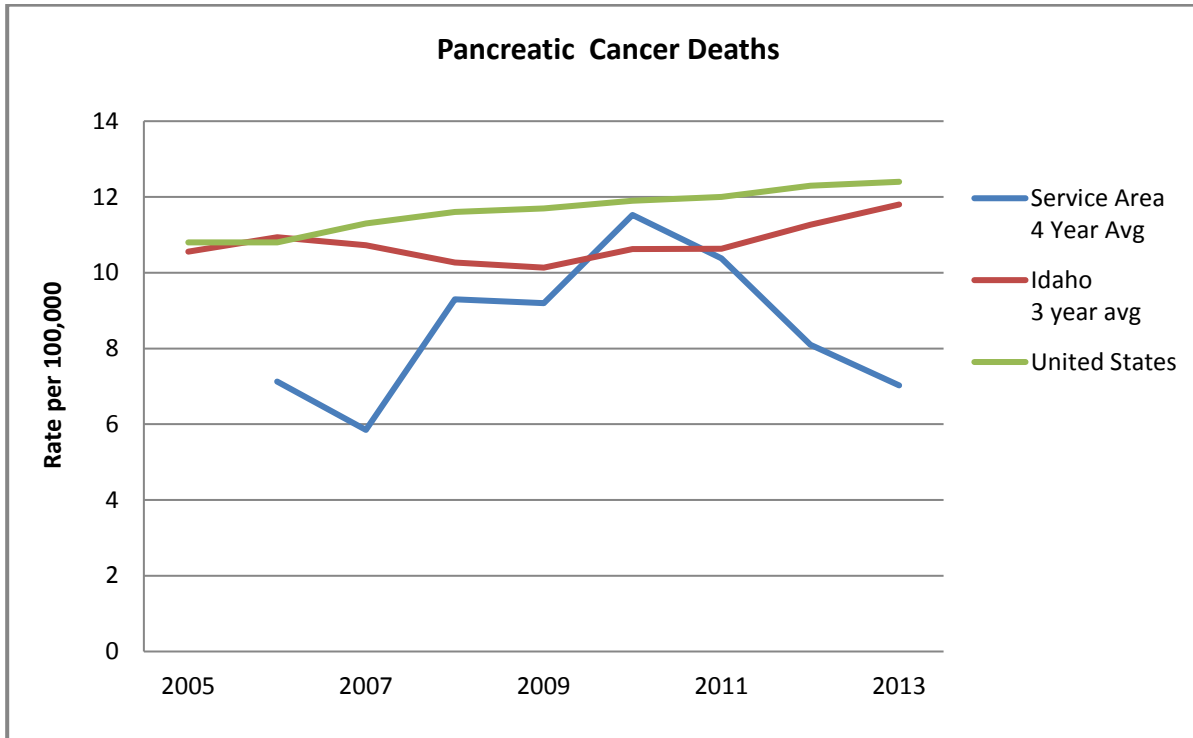

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>67</sup> Comprehensive Cancer Alliance for Idaho, Idaho Comprehensive Cancer Strategic Plan 2004-2010, [www.ccaidaho.org](http://www.ccaidaho.org)

- **Pancreatic Cancer**

In our service area, the pancreatic cancer death rate is lower than the national average.<sup>68</sup> There are no established guidelines for preventing pancreatic cancer and the survival rate is low. Possible factors increasing the risk of pancreatic cancer include smoking and type 2 diabetes, which is associated with obesity.<sup>69</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude	Total Score
Pancreatic Cancer	2	1	1	0	4

<sup>68</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2010, National Vital Statistics Report - Deaths: Data 2010

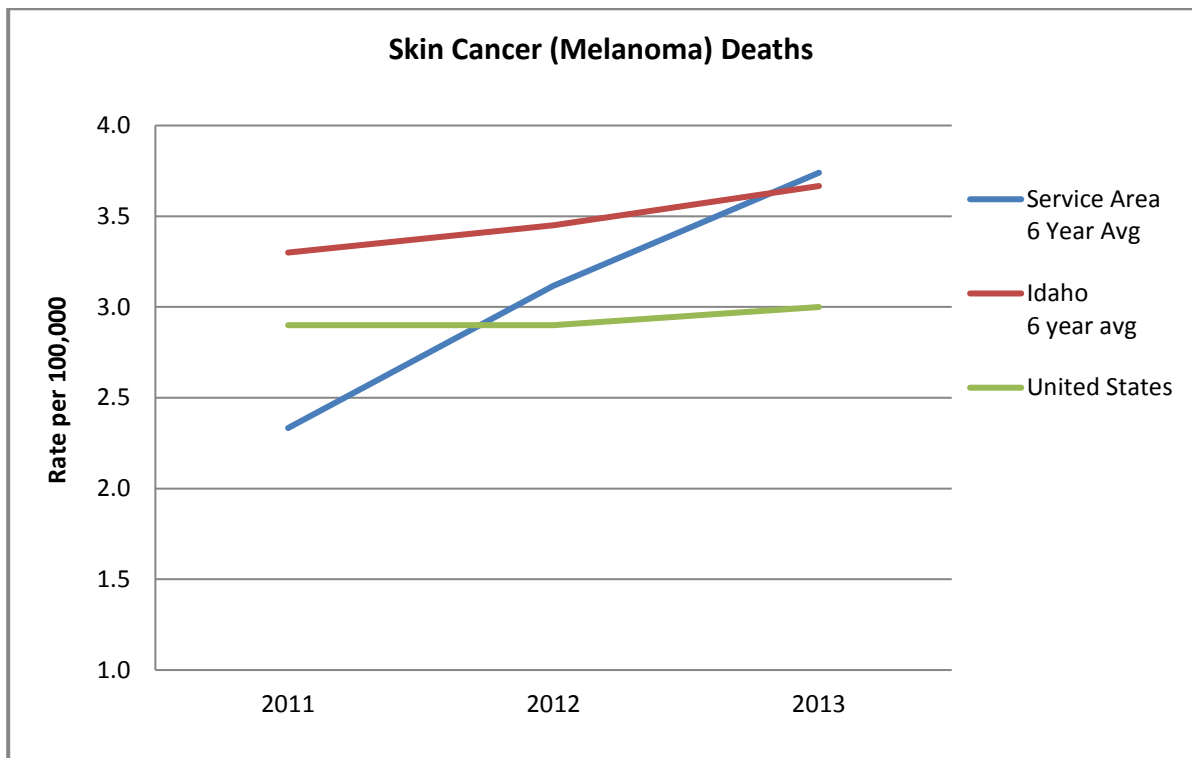

<sup>69</sup> Comprehensive Cancer Alliance for Idaho, Idaho Comprehensive Cancer Strategic Plan 2004-2010, [www.ccaidaho.org](http://www.ccaidaho.org)

- **Skin Cancer (Melanoma)**

In 2008, more than 1 million people were diagnosed with skin cancer, making it the most common of all cancers. More people were diagnosed with skin cancer in 2008 than with breast, prostate, lung, and colon cancer combined. About 1 in 5 Americans will develop skin cancer during their lifetime. For people born in 2005, 1 in 55 will be diagnosed with melanoma— nearly 30 times the rate for people born in 1930.<sup>70</sup>

Idaho had the highest melanoma death rate nationally from 2001-2005—26% higher than the U.S. average. About 50 people in the state die of melanoma every year. New diagnoses of melanoma increased at a rate of about 3.6% per year in Idaho from 1975 to 2006. The rate of increase was higher for males (4.2% per year) than for females (2.8% per year).

The chart shows that melanoma death rates are higher in Idaho and our service area than in the rest of the nation.<sup>71</sup>

Exposure to ultraviolet (UV) radiation appears to be the most significant factor in the development of skin cancer. Skin cancer is largely preventable when sun protection measures are used consistently. These results highlight the need for effective

<sup>70</sup> [www.epa.gov/sunwise/statefacts.html](http://www.epa.gov/sunwise/statefacts.html)

---

<sup>72</sup> Comprehensive Cancer Alliance for Idaho, Idaho Comprehensive Cancer Strategic Plan 2004-2010, [www.ccaidaho.org](http://www.ccaidaho.org)

- **Leukemia**

The leukemia death rate in our service area is slightly lower than the national average and the trend is flat.<sup>73</sup> Leukemia is a cancer of the bone marrow and blood. Scientists do not fully understand the causes of leukemia, although researchers have found some associations. Chronic exposure to benzene at work, large doses of radiation, and smoking tobacco all are risk factors associated with some forms of leukemia.<sup>74</sup> Because the causes are not well understood, evidence-based preventive programs are not available (other than avoiding the risk factors described above).

<sup>76</sup> [www.cdc.gov/Features/HematologicCancers/](http://www.cdc.gov/Features/HematologicCancers/)

- **Diseases of the Heart**

The heart disease death rate has been declining over the past 10 years.<sup>77</sup> It's important to note that even though mortality rates are declining, many individuals are living with chronic cardiac disease as new procedures prolong their lives.

Heart disease remains the leading cause of death in the United States for both men and women. It is the second leading cause of death in Idaho.<sup>78</sup> The death rate from heart disease in our service area is well below the national average.

Heart disease is a long-term illness that many individuals can manage through lifestyle changes and healthcare interventions. However, many interventions place a burden on affected individuals by constraining options and activities available to them and can result in costly and ongoing expenditures for health care. It's important to keep cholesterol levels and blood pressure in check to prevent heart disease.<sup>79</sup>

Health Factor Score

<sup>78</sup> America's Health Rankings 2011, [www.americashealthrankings.org](http://www.americashealthrankings.org)

<sup>79</sup> Ibid.

- **Chronic Lower Respiratory Diseases**

The chronic lower respiratory diseases death rate in our service area is much lower than the national average and the trend has been flat. Chronic lower respiratory diseases are the third leading cause of death in Idaho.<sup>80</sup> Of the diseases included in the data, chronic bronchitis and emphysema account for the majority of the deaths. The main risk factors for these diseases are smoking, repeated exposure to harsh chemicals or fumes, air pollution, or other lung irritants.<sup>81</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>82</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2010, National Vital Statistics Report - Deaths: Data 2010

- **Cerebrovascular Diseases**

Nationally, the death rate for cerebrovascular diseases has decreased substantially over the past 10 years. However, they are still the fifth leading cause of death in Idaho and the nation. In our service area, the cerebrovascular diseases death rate is up since the year 2005 but is still lower than the national average.<sup>83</sup> Cerebrovascular diseases include a number of serious disorders, including stroke and cerebrovascular anomalies such as aneurysms. Cerebrovascular diseases can be reduced when people lead a healthy lifestyle that includes being physically active, maintaining a healthy weight, eating well, and not using tobacco.<sup>84</sup>

Health Factor Score

<sup>83</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2012

<sup>84</sup> America's Health Rankings 2015, www.americashealthrankings.org

- **Diabetes Mellitus**

Diabetes is the sixth leading cause of death in Idaho. The death rate from diabetes in our service area is significantly lower than the national average but has been trending up particularly over the last several of years. Diabetes is a serious health issue that can contribute to heart disease, stroke, high blood pressure, kidney disease, blindness and can even result in limb amputation or death.<sup>85</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

Diabetes Deaths	4	0	3	4	11

<sup>85</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2012

- **Alzheimer’s disease**

Alzheimer’s is the seventh leading cause of death in Idaho. Nationally, the death rate from Alzheimer’s has increased over the past 10 years. The death rate in our service area has been increasing but is still well below the national rate.<sup>86</sup>

Alzheimer's is the most common form of dementia, a general term for serious loss of memory and other intellectual abilities. Alzheimer's disease accounts for 50 to 80% of dementia cases. Alzheimer's is not a normal part of aging, although the greatest known risk factor is increasing age, and the majority of people with Alzheimer's are 65 and older. Although current treatments cannot stop Alzheimer's from progressing, they can temporarily slow the worsening of dementia symptoms and improve quality of life for those with Alzheimer's and their caregivers.<sup>87</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>86</sup> Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2012

<sup>87</sup> Alzheimer’s Association, www.alz.org

- **Suicide**

Idaho consistently is listed in the top 10 states in the country for its rate of suicide. Suicide is the eighth leading cause of death in Idaho. The suicide death rate per 100,000 people in Idaho was 19.1 in 2013 which is about 50% higher than the national average rate of 12.9. The suicide rate in our service area was 21.4, which is 67% higher than the national average. As shown in the chart below, the suicide rate in our service area, Idaho, and the nation has been trending up.

The suicide rate for males is about four times higher than the rate for females.<sup>88</sup> U.S. male veterans are twice as likely to die by suicide as males without military service. Many suicides can be prevented by ensuring people are aware of warning signs, risk factors, and protective factors.<sup>89</sup>

	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Suicide	3	4	4	1	12

<sup>88</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2013

<sup>89</sup> Idaho Council on Suicide Prevention, Report to Governor C.L. Otter, November 2009

- **Influenza and Pneumonia**

The death rate from flu and pneumonia is decreasing in our service area and is much lower than the national average.<sup>90</sup>

Influenza is a contagious respiratory illness caused by influenza viruses that infect the nose, throat, and lungs. It can cause mild to severe illness, and at times can lead to death. The best way to prevent the flu is by getting a flu vaccination each year.<sup>91</sup>

Pneumonia is an infection of the lungs that is usually caused by bacteria or viruses. Globally, pneumonia causes more deaths than any other infectious disease. However, it can often be prevented with vaccines and can usually be treated with antibiotics or antiviral drugs. People with health conditions, like diabetes and asthma, should be encouraged to get vaccinated against the flu and bacterial pneumonia.<sup>92</sup>

Health Factor Score

<sup>91</sup> <http://www.cdc.gov/flu/keyfacts.htm>

<sup>92</sup> <http://www.cdc.gov/Features/Pneumonia/>

- **Nephritis**

The death rate from nephritis is lower in our community than it is nationally. However, the nephritis death rate is increasing substantially in our service.<sup>93</sup>

Nephritis is an inflammation of the kidney, which causes impaired kidney function. A variety of conditions can cause nephritis, including kidney disease, autoimmune disease, and infection. Treatment depends on the cause. Kidney disease damages kidneys, preventing them from cleaning blood effectively. Chronic kidney disease eventually can cause kidney failure if it is not treated.<sup>94</sup>

Because chronic kidney disease often develops slowly and with few symptoms, many people aren't diagnosed until the disease is advanced and requires dialysis. Blood and urine tests are the only ways to determine if a person has chronic kidney disease. It's important to be diagnosed early. Treatment can slow down the disease, and prevent or delay kidney failure.

<sup>93</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2012

<sup>94</sup> [www.cdc.gov/Features/WorldKidneyDay/](http://www.cdc.gov/Features/WorldKidneyDay/)

Steps to help keep kidneys healthy include:

- Keep blood pressure below 130/80 mm/Hg. If blood pressure is high, it should be checked regularly and brought under control through diet, exercise, or blood pressure medication.
- Stay in target cholesterol range.
- Eat less salt and salt substitutes.
- Eat healthy foods.
- Stay physically active.

If a person has diabetes, they should take these additional steps:

- Meet blood sugar targets.
- Have an A1c test at least twice a year, but ideally up to four times a year. An A1c test measures the average level of blood sugar over the past three months.<sup>95</sup>

## Health Factor Measures and Findings

The health outcomes described in the previous section tell us how healthy we are now. Health factors give us clues about how healthy we are likely to be in the future.

Health factors represent key influencers of poor health that if addressed with effective, evidence-based programs and policies can improve health outcomes. Diet, exercise, educational attainment, environmental quality, employment opportunities, quality of health care, and individual behaviors all work together to shape community health outcomes and wellbeing.<sup>96</sup> The *County Health Rankings* uses four categories of health factors:

- Health behaviors
- Clinical care
- Social and economic factors
- Physical environment

In addition to *County Health Ranking* measures, we collect community health factors from national, state, and local perspectives to create a broader set of health indicators and measures for our community. These additional indicators are determined by the Idaho Department of Health and Welfare, the Centers for Disease Control and Prevention (CDC), or other authoritative sources to represent important health risk factors.

One tool we utilize is the Behavioral Risk Factor Surveillance System (BRFSS), an ongoing surveillance program developed and partially funded by the CDC. The tool's recent data and comprehensive scope make it an ideal mechanism to monitor and track key health factors nationally and throughout Idaho.

## Health Behavior Factors

### ***County Health Rankings* Health Behavior Factors**

The *County Health Rankings* measures for community health behavior are described on the following pages. This next section also includes the trends for each indicator in our community and, when possible, compares our local data to state and national averages.

---

<sup>96</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

- **Adult Smoking**

The relationship between tobacco use, particularly cigarette smoking, and adverse health outcomes is well known. In fact, cigarette smoking is the leading cause of preventable death. Smoking causes or contributes to cancers of the lung, pancreas, kidney, and cervix. An average of 1,500 people die each year in Idaho as a direct result of tobacco use.<sup>97</sup>

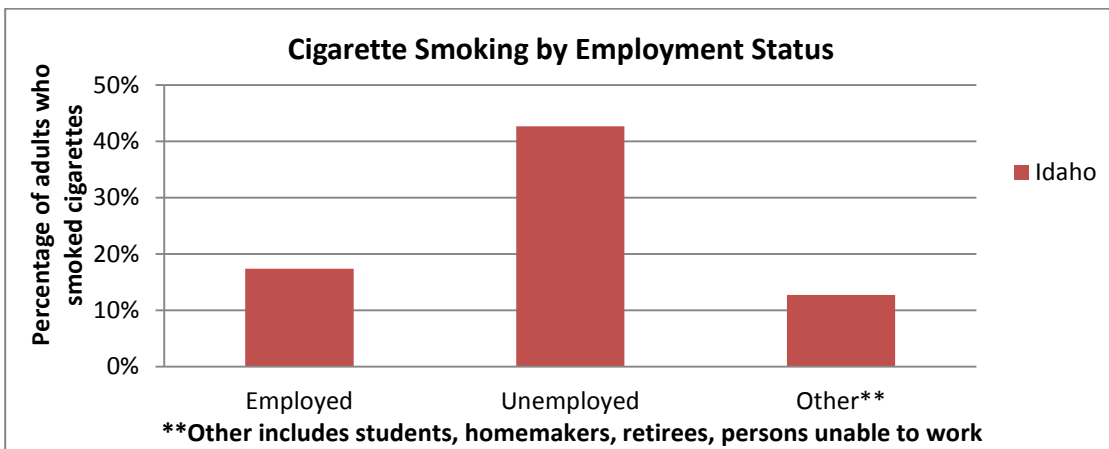

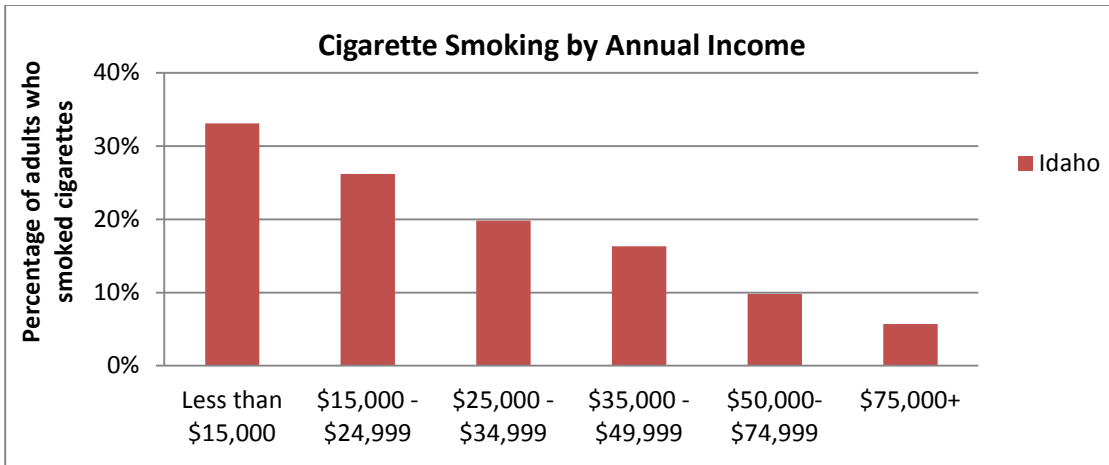

County-level measures from the Behavioral Risk Factor Surveillance System (BRFSS) provided by the CDC are used to obtain the number of current adult smokers who have smoked at least 100 cigarettes in their lifetime. The trend for smoking nationally and in Idaho is down. Looking at the last couple of years it appears as though the trend is flattening out or is rising; however, this is more likely due to a change in the BRFSS survey methodology starting in 2011. The percent of adults who smoked in our service area is well below the national average.<sup>98</sup>

The percent of people who smoke declines significantly with higher levels of income and education as well as for those who are employed, as shown in the charts below.

Smoking	1	0	4	4	9

## Diet and Exercise

Unhealthy food intake and insufficient exercise have economic impacts for individuals and communities. Current estimates for obesity-related health care costs in the US range from \$147 billion to nearly \$210 billion annually, and productivity losses due to job absenteeism cost an additional \$4 billion each year. Increasing opportunities for exercise and access to healthy foods in neighborhoods, schools, and workplaces can help children and adults eat healthy meals and reach recommended daily physical activity levels. <sup>99</sup>

Four measures are recommended by the *County Health Rankings* to assess diet and exercise: Adult obesity, food environment index, physical inactivity, and access to exercise opportunities. Each of these measures are described in the following pages.

---

<sup>99</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

- **Adult Obesity**

The obesity measure represents the percent of the adult population that has a body mass index greater than or equal to 30. Obesity is used as a key health factor because it is an issue that can be addressed within communities by changing unhealthy conditions that contribute to poor diet and exercise. Being overweight or obese increases the risk for a number of health conditions: Coronary heart disease, type 2 diabetes, cancer, hypertension, dyslipidemia, stroke, liver and gallbladder disease, sleep apnea and respiratory problems, osteoarthritis, gynecological problems (infertility and abnormal menses), and poor health status.<sup>100</sup> It has many long-term negative health effects, many of which can start in adolescence as 70 percent of obese adolescents already have at least one risk factor for cardiovascular disease. Obesity is one of the greatest health threats to the United States.<sup>101</sup> By one estimate, the U.S. spent \$190 billion on obesity-related health care expenses in 2005 accounting for 21% of all medical spending.<sup>102</sup>

The trend for obesity has been increasing steadily for the past 10 years, nationally and in our community. Obesity in our community is now increasing faster than the national average. However, levels of obesity in our community are still much lower than the national average and in the top 10<sup>th</sup> percentile (best). The top 10<sup>th</sup> percentile rate is at or below 25%.<sup>103</sup>

In Idaho, those without a college degree, with incomes below \$75,000, and Hispanic populations are more likely to be obese.<sup>104</sup>

<sup>104</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

Health Factor Score					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Obese Adults	4	0	4	4	12

- **Food Environment Index**

The food environment index is a measure ranging from 0 (worst) to 10 (best) which equally weights two indicators of the food environment.

1) Limited access to healthy foods estimates the proportion of the population who are low income and do not live close to a grocery store. Living close to a grocery store is defined differently in rural and non-rural areas; in rural areas, it means living less than 10 miles from a grocery store whereas in non-rural areas, it means less than 1 mile. Low income is defined as having an annual family income of less than or equal to 200 percent of the federal poverty threshold for the family size.

2) Food insecurity estimates the percentage of the population who did not have access to a reliable source of food during the past year. A 2-stage fixed effect model was created using information from the Community Population Survey, Bureau of Labor Statistics, and American Community Survey.

There are many facets to a healthy food environment. This measure considers both the community and consumer nutrition environments. It includes access in terms of the distance an individual lives from a grocery store or supermarket. There is strong evidence that residing in a “food desert” is correlated with a high prevalence of overweight, obesity, and premature death. Supermarkets traditionally provide healthier options than convenience stores or smaller grocery stores. The additional measure, limited access to healthy foods, included in the index is a proxy for capturing the community nutrition environment and food desert measurements.

Additionally, low income can be another barrier to healthy food access. Food insecurity, the other food environment measure included in the index, attempts to capture the access issue by gaining a better understanding of the barrier of cost. Lacking constant access to food is related to negative health outcomes such as weight-gain and premature mortality. In addition to asking about having a constant food supply in the past year, the module also addresses the ability of individuals and families to provide balanced meals further addressing barriers to healthy eating. The consumption of fruits and vegetables is important but it may be equally important to have adequate access to a constant food supply.<sup>105</sup>

---

<sup>105</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

The chart below shows that the food environment index levels for our community and Idaho are about the same as the national average. An index level of 8.4 or above is the top 10% nationally.

Health Factor Score					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Food Environment Index	2	2	2	3	9

- **Physical Inactivity: Adults**

Increased physical activity is associated with lower risks of type 2 diabetes, cancer, stroke, hypertension, cardiovascular disease, and premature mortality. A person is considered physically inactive if during the past month, other than a regular job, they did not participate in any physical activities or exercises such as running, calisthenics, golf, gardening, or walking for exercise. Half of adults and nearly 72% of high school students in the US do not meet the CDC’s recommended physical activity levels, and American adults walk less than adults in any other industrialized country.<sup>106</sup>

As shown in the chart below, physical inactivity in our community is much lower than the national average. The top 10<sup>th</sup> percentile (best) is 20%, and our community is doing much better than that.<sup>107</sup>

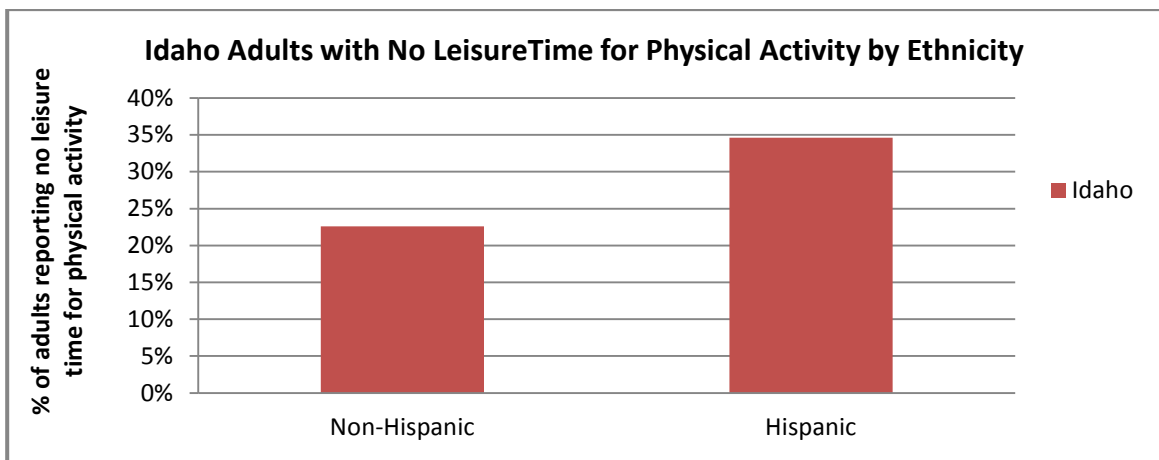

Physical inactivity is significantly higher among people with annual incomes below \$50,000, those without a college degree, and among Hispanics, as shown in the charts below.<sup>108</sup>

<sup>106</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>107</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>108</sup> Ibid.

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Physical inactivity Adults	2	0	2	3	7

- **Access to Exercise Opportunities**

The role of the built environment is important for encouraging physical activity. Individuals who live closer to sidewalks, parks, and gyms are more likely to exercise. Access to exercise opportunities measures the percentage of individuals in a county who live reasonably close to a location for physical activity. Locations for physical activity are defined as parks or recreational facilities. Parks include local, state, and national parks. Recreational facilities include businesses identified by the NAICS code 713940, and include a wide variety of facilities including gyms, community centers, YMCAs, dance studios and pools.

This is the first national measure created which captures the many places where individuals have the opportunity to participate in physical activity outside of their homes. It is not without several limitations. First, no dataset accurately captures all the possible locations for physical activity within a county. One location for physical activity that is not included in this measure are sidewalks which serve as common locations for running or walking. Additionally, not all locations for physical activity are identified by their primary or secondary business code.<sup>109</sup>

The chart, below, shows access to exercise opportunities in our community is above the national average. The top ten percent nationally is 92%, and we are at 91%.

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Access to Exercise Opportunities	1	2	2	3	8

<sup>109</sup> University of Wisconsin Population Health Institute. *County Health Rankings 2015*. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

## Alcohol Use

Two measures are combined to assess alcohol use in a county: Percent of excessive drinking in the adult population and the percentage of motor vehicle crash deaths with alcohol involvement.

- **Excessive Drinking**

The excessive drinking statistic comes from the Behavioral Risk Factor Surveillance System (BRFSS). The measure aims to quantify the percentage of females that consume four or more and males who consume five or more alcoholic beverages in one day at least once a month. Excessive drinking is a risk factor for a number of adverse health outcomes. These include alcohol poisoning, hypertension, acute myocardial infarction, sexually transmitted infections, unintended pregnancy, fetal alcohol syndrome, sudden infant death syndrome, suicide, interpersonal violence, and motor vehicle crashes. It is the third leading lifestyle-related cause of death for people in the US.<sup>110</sup>

The percent of people engaging in excessive drinking in our service area is above the national average. The top 10<sup>th</sup> percentile (best) is 10% nationally. Our community is well above that level.<sup>111</sup>

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
<b>Excessive Drinking</b>	<b>1</b>	<b>3</b>	<b>3</b>	<b>2</b>	<b>9</b>

<sup>110</sup> University of Wisconsin Population Health Institute. *County Health Rankings 2012-2015*. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>111</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

- **Alcohol Impaired Driving Deaths**

Alcohol-impaired driving deaths is the percentage of motor vehicle crash deaths with alcohol involvement. Alcohol-impaired driving deaths directly measures the relationship between alcohol and motor vehicle crash deaths. One limitation of this measure is that not all fatal motor vehicle traffic accidents have a valid blood alcohol test, so these data are likely an undercount of actual alcohol involvement. Another potential limitation is that even though alcohol is involved in all cases of alcohol-impaired driving, there can be a large difference in the degree to which it was responsible for the crash (i.e. someone with a 0.01 BAC vs. 0.35 BAC). The data source is the Fatality Analysis Reporting System (FARS), which is a census of fatal motor vehicle crashes. Our alcohol-impaired driving death rate is well below the national level. The top 10<sup>th</sup> percentile (best) is 14% nationally.<sup>112</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Motor vehicle crash death rate	1	1	4	1	7

<sup>112</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2013

## Unsafe Sex

Two measures are used to represent the Unsafe Sex focus area: Teen birth rates and sexually transmitted infection incidence rates. First, the birth rate per 1,000 female population ages 15-19 as measured and provided by the National Center for Health Statistics (NCHS) is reported. Additionally, the chlamydia rate per 100,000 people was provided by the Centers for Disease Control and Prevention (CDC). Measuring teen births and the chlamydia incidence rate provides communities with a sense of the level of risky sexual behavior.

- **Teen Birth Rate**

Evidence suggests teen pregnancy significantly increases the risks for repeat pregnancy and for contracting a sexually transmitted infection (STI), both of which can result in adverse health outcomes for mother and child as well as for the families and community. A systematic review of the sexual risk among pregnant and mothering teens concludes that pregnancy is a marker for current and future sexual risk behavior and adverse outcomes. The review found that nearly one-third of pregnant teenagers were infected with at least one STI. Furthermore, pregnant and mothering teens engage in exceptionally high rates of unprotected sex during pregnancy and postpartum, and are at risk for additional STIs and repeat pregnancies.

Teen pregnancy is associated with poor prenatal care and pre-term delivery. Pregnant teens are more likely than older women to receive late or no prenatal care, have gestational hypertension and anemia, and achieve poor maternal weight gain. They are also more likely to have a pre-term delivery and low birth weight, increasing the risk of child developmental delay, illness, and mortality.<sup>113</sup>

Our rate of teen pregnancy is decreasing, and is below the national average. In fact, our teen pregnancy rate is 18.0 placing us in the national top 10<sup>th</sup> percentile (<19.5).<sup>114</sup>

---

<sup>113</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>114</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2013

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Teen birth rate	0	0	2	3	5

- **Sexually Transmitted Infections**

Sexually transmitted infections (STI) data are important for communities because the burden of STIs is not only on individual sufferers, but on society as a whole. Chlamydia, in particular, is the most common bacterial STI in North America and is one of the major causes of tubal infertility, ectopic pregnancy, pelvic inflammatory disease, and chronic pelvic pain. Additionally, STIs in general are associated with significantly increased risk of morbidity and mortality, including increased risk of cervical cancer, pelvic inflammatory disease, involuntary infertility, and premature death.<sup>115</sup>

The rate of chlamydia infections has increased over the past ten years both in our community and nationally. Although our community is below the national average, we are still above the national top 10<sup>th</sup> percentile rate of 138.2.<sup>116</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

## Additional Health Behavior Factors

- Overweight and Obese Adults**

In addition to the percent of obese adults included as part of our *County Health Rankings* factors, we added the percentage of overweight and obese adults. Being overweight or obese increases the risk for a number of health conditions: Coronary heart disease, type 2 diabetes, cancer, hypertension, dyslipidemia, stroke, liver and gallbladder disease, sleep apnea and respiratory problems, osteoarthritis, gynecological problems (infertility and abnormal menses), and poor health status.

The trend for overweight and obese adults has been increasing steadily for the past 10 years, nationally and in our community.<sup>117</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
<b>Overweight or Obese Adults</b>	<b>4</b>	<b>0</b>	<b>4</b>	<b>4</b>	<b>12</b>

<sup>117</sup> Idaho and National 2002 - 2010 Behavioral Risk Factor Surveillance System

- **Overweight and Obese Teens**

We included the percentage of obese and overweight teenagers in our community to ensure an understanding of youth health behavior risks. People who were already overweight in adolescence (14-19 years old) have an increased mortality rate from a range of chronic diseases as adults: endocrine, nutritional and metabolic diseases, cardiovascular diseases, colon cancer, and respiratory diseases. There were also many cases of sudden death in this group.<sup>118</sup> Overweight children and adolescents:

- Are more likely than other children and adolescents to have risk factors associated with cardiovascular disease (e.g., high blood pressure, high cholesterol and type 2 diabetes).
- Are more likely to be obese as adults.
- Are more likely to experience other health conditions associated with increased weight including asthma, liver problems and sleep apnea.
- Have higher long-term risk of chronic conditions such as stroke; breast, colon, and kidney cancers; musculoskeletal disorders; and gall bladder disease.

Some methods of preventing and treating overweight children are:

- Reducing caloric intake is the easiest change. Highly restrictive diets that forbid favorite foods are likely to fail. They should be limited to rare patients with severe complications who must lose weight quickly.
- Becoming more active is widely recommended. Increased physical activity is common in all studies of successful weight reduction. Create an environment that fosters physical activity.
- Parents' involvement in modifying overweight children's behavior is important. Parents who model healthy eating and physical activity can positively influence their children's health.<sup>119</sup>

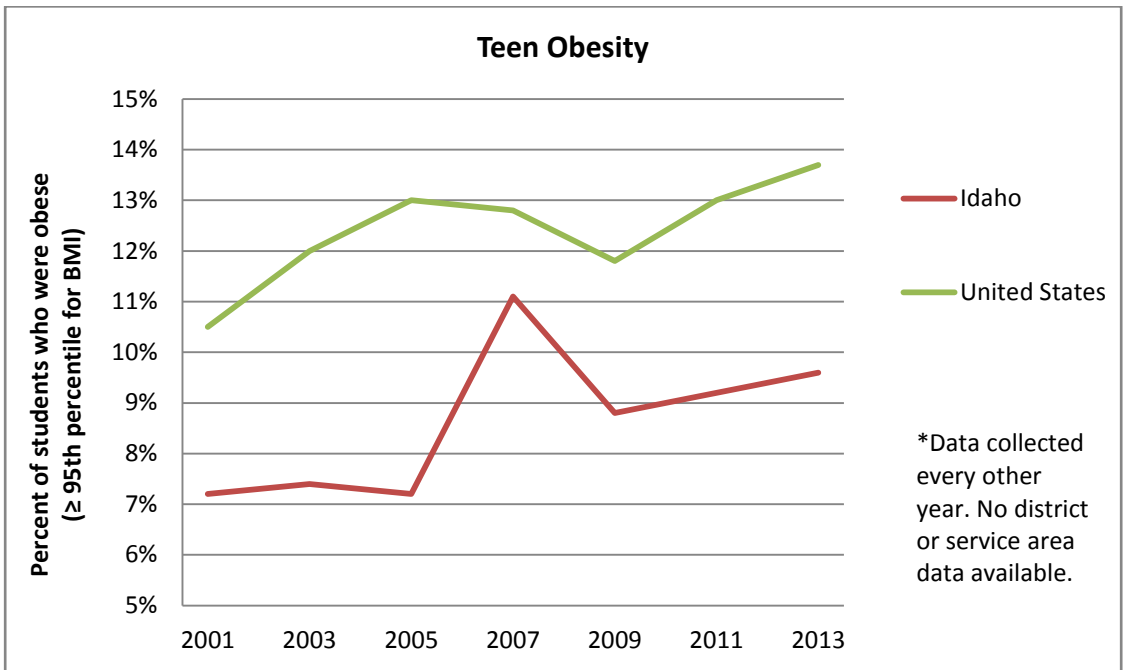

The percent of overweight or obese teens in Idaho is lower than the national average. However, the trend for obesity and overweight youth is increasing both in Idaho and across the United States. Overweight youth are defined as being ≥85th percentile but <95th percentile for body mass index, based on sex- and age-specific reference data from the 2000 CDC growth charts. Obese youth are defined by the CDC as being ≥95th percentile for body mass index, based on sex- and age-specific reference data from the 2000 CDC growth charts.<sup>120</sup>

<b>Obese Teens</b>	<b>4</b>	<b>1</b>	<b>4</b>	<b>4</b>	<b>13</b>

- **Nutritional Habits: Adults – Fruit and Vegetable Consumption**

Eating a diet high in fruits and vegetables is important to overall health, because these foods contain essential vitamins, minerals, and fiber that may help protect from chronic diseases. Dietary guidelines recommend that at least half of your plate consist of fruit and vegetables and that half of your grains be whole grains. This combined with reduced sodium intake, fat-free or low-fat milk and reduced portion sizes lead to a healthier life. Data collected for this measure focus on the consumption of vegetables and fruits at the recommended five portions per day.<sup>121</sup> These data are collected through the Behavioral Risk Factor Surveillance System.

As shown in the chart below, about 75% of the people in our service area did not eat the recommended amounts of fruits and vegetables. The national average was about 77%. The trend appears to have changed marginally in recent years, but that may be due to a change in the BRFSS survey methodology starting in 2011. There are no large differences in nutritional habits based on income or education.<sup>122</sup>

<sup>123</sup> Youth Risk Behavior Surveillance ,Idaho and United States, 2001 – 2013, [www.cdc.gov/yrbs/](http://www.cdc.gov/yrbs/)

- **Physical Activity: Youth**

Physical activity helps build and maintain healthy bones and muscles, control weight, build lean muscle, reduce fat, and improve mental health (including mood and cognitive function). It also helps prevent sudden heart attack, cardiovascular disease, stroke, some forms of cancer, type 2 diabetes and osteoporosis. Additionally, regular physical activity can reduce other risk factors like high blood pressure and cholesterol.

As children age, their physical activity levels tend to decline. As a result, it’s important to establish good physical activity habits as early as possible. A recent study suggests that teens who participate in organized sports during early adolescence maintain higher levels of physical activity in late adolescence compared to their peers, although their activity levels do decline. And youth who are physically fit are much less likely to be obese or have high blood pressure in their 20s and early 30s.<sup>124</sup>

The chart below shows that about 45% of Idaho teens do not exercise as much as recommended, which is better than the national average. The trend in Idaho has been relatively flat over the past four years.<sup>125</sup>

<sup>125</sup> Youth Risk Behavior Surveillance , United States, 2001 – 2013, www.cdc.gov/yrbs/

- **Illicit Drug Use**

The use of illicit drugs has harmful and sometimes devastating effects on individuals, families, and society.<sup>126</sup> The percent of people who reported using illicit drugs in our service area is more than twice as high as Idaho as a whole. Illicit drug use is significantly higher among males less than 34 years old, the unemployed, and those with incomes of less than \$50,000 annually.<sup>127</sup>

<sup>126</sup> [www.samhsa.gov/newsroom/advisories/1109075503.aspx](http://www.samhsa.gov/newsroom/advisories/1109075503.aspx)

Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Illicit drug use	2	4	4	3	13

- **Youth Smoking**

In 2013, approximately 6.8 percent of Idaho Youth reported smoking at least one cigarette every day for 30 days. This is well below the national rate of 8.8%. During 1997–2013, a significant linear decrease occurred overall in the prevalence of current tobacco use among Idaho and our nation’s youth. However, the progress has been slowing over the past ten years.<sup>128</sup>

Prevention efforts must focus on young adults ages 18 through 25, too. Almost no one starts smoking after age 25. Nearly 9 out of 10 smokers started smoking by age 18, and 99% started by age 26. Progression from occasional to daily smoking almost always occurs by age 26. This is why prevention is critical. Successful multi-component programs prevent young people from starting to use tobacco in the first place and more than pay for themselves in lives and health care dollars saved. Strategies that comprise successful comprehensive tobacco control programs include mass media campaigns, higher tobacco prices, smoke-free laws and policies, evidence-based school programs, and sustained community-wide efforts.<sup>129</sup>

## Clinical Care Factors

### County Health Rankings Clinical Care Factors

#### Health Care Access

Health care access is represented with two measures. The first measure is the adult population without health insurance and the second is primary care providers.

- **Uninsured Adults**

Evidence shows that uninsured individuals experience more adverse outcomes (physically, mentally, and financially) than insured individuals. The uninsured are less likely to receive preventive and diagnostic health care services, are more often diagnosed at a later disease stage, and on average receive less treatment for their condition compared to insured individuals. At the individual level, self-reported health status and overall productivity are lower for the uninsured. The Institute of Medicine reports that the uninsured population has a 25% higher mortality rate than the insured population.<sup>130</sup>

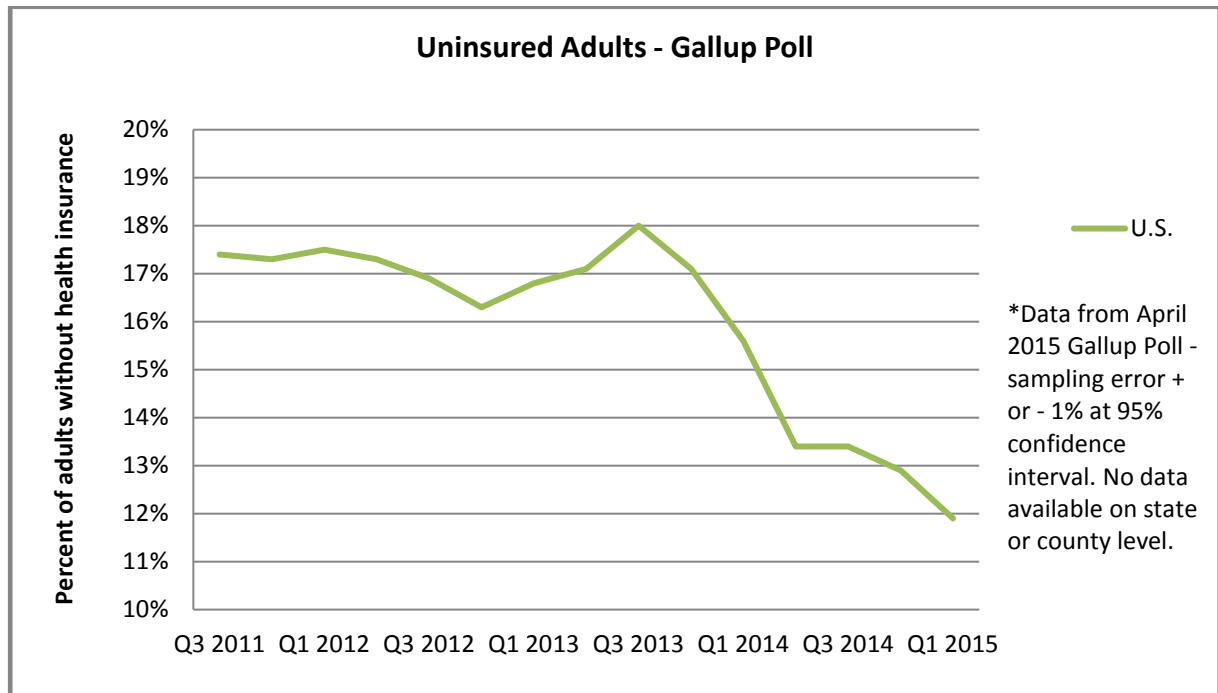

The chart below shows the number of adults without health care coverage has been trending up for the past ten years nationally and in our service area. The percentage of uninsured in Idaho and our service area is higher than the national average.<sup>131</sup>

<sup>130</sup> University of Wisconsin Population Health Institute. *County Health Rankings 2010-2015*. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>131</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

A Gallup Poll administered quarterly provides more recent data on uninsured adults. The graph below shows that on a national basis the 2010 Affordable Care Act (ACA) dramatically lowered the percentage of uninsured adults starting in 2014. One of the major provisions of the ACA is the expansion of Medicaid eligibility to nearly all low-income individuals with incomes at or below 138 percent of poverty. However, as of March 2015, 22 states had not expanded their programs. The ACA did not make provisions for low income people not receiving Medicaid and does not provide assistance for people below poverty for other coverage options.<sup>132</sup> As of June 2015, Idaho is one of the states that opted not to expand Medicaid. Consequently, many adults in Idaho fall into a “coverage gap.”

The goal of the ACA is to improve health outcomes and eventually lower health care costs through insuring a greater proportion of the population. *24/7 Wall St.* conducted a study showing the percentage point decline in uninsured rates for each state from 2012 through 2015. In Idaho, the percent of uninsured people declined 6.6 percentage points, which is a larger improvement than the nation as a whole. The percentage of all Americans without health insurance declined 5.7 percentage points.<sup>133</sup>

<sup>132</sup> The Coverage Gap: Uninsured Poor Adults in States the do not Expand Medicaid, April 2015, The Kaiser Commission on Medicaid and the Uninsured, Rachel Garfield

<sup>133</sup> 24/7 Wallst.com

The charts below show that income and education greatly affect the likelihood of people having health insurance. For example, those with incomes of less than \$25,000 are about 10 times more likely to report being without health care coverage than those with incomes above \$75,000. In addition, Hispanics are more than twice as likely to not have health insurance coverage as non-Hispanics.<sup>134</sup>

<sup>134</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Uninsured adults	1	4	4	3	12

- **Primary Care Providers**

The second measure of health care access reports the ratio of population in a county to primary care providers (i.e., the number of people per primary care provider). The measure is based on data obtained from the Health Resources and Services Administration (HRSA) through the County Health Rankings. While having health insurance is a crucial step toward accessing the different aspects of the health care system, health insurance by itself does not ensure access. In addition, evidence suggests that access to effective and timely primary care has the potential to improve the overall quality of care and help reduce costs. One analysis found that primary care physician supply was associated with improved health outcomes including reduced all-cause cancer, heart disease, stroke, and infant mortality; a lower prevalence of low birth weight; greater life expectancy; and improved self-rated health. The same analysis also found that each increase of one primary care physician per 10,000 people is associated with a reduction in the average mortality by 5.3%.<sup>135</sup>

The chart below shows the population to primary care provider ratio was lower than the national average in our community.

Health Factor Score

<sup>135</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

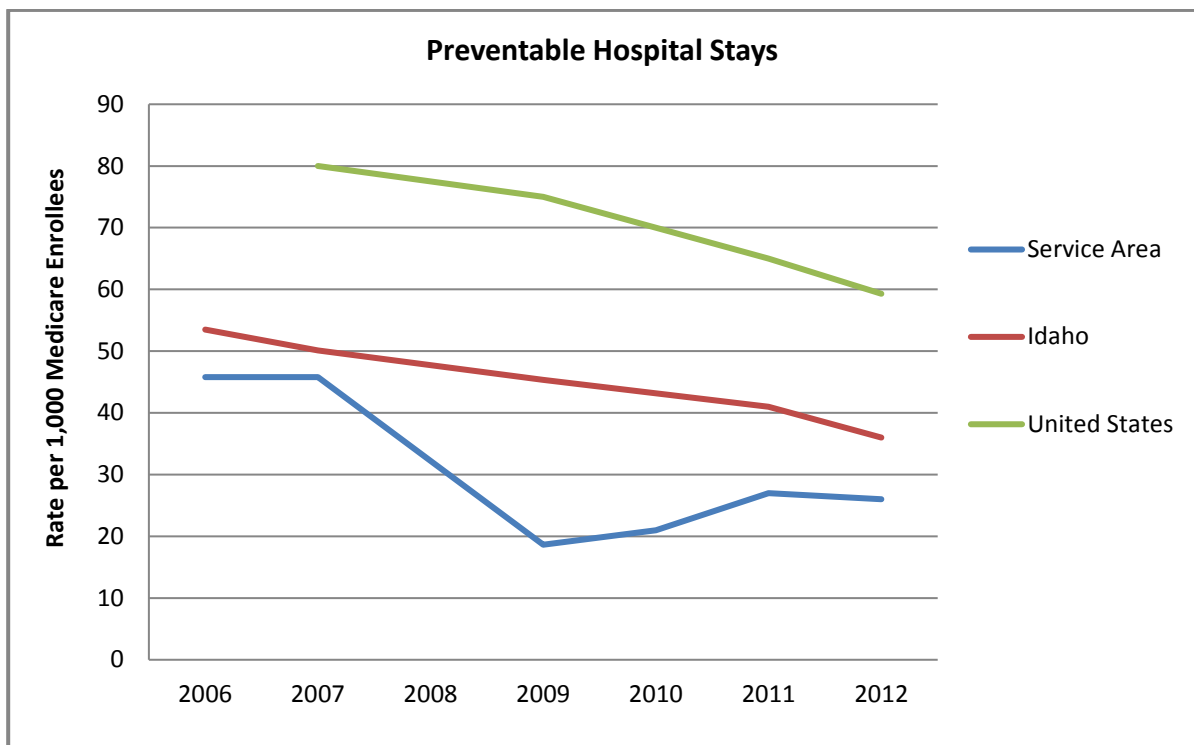

## Health Care Quality

- Preventable Hospital Stays**

Three separate measures are used to report health care quality. The first measure is preventable hospitalizations, or the hospitalization rate for ambulatory-care sensitive conditions per 1,000 Medicare enrollees. Ambulatory-care sensitive conditions (ACSC) are usually addressed in an outpatient setting and do not normally require hospitalization if the condition is well managed.

The rate of preventable hospital stays for our service area is 26, which is in the top 10<sup>th</sup> percentile nationally. The national top 10<sup>th</sup> percentile is 41.2.<sup>136</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Preventable Hospital Stays	1	0	2	4	7

<sup>136</sup> Ibid.

- **Diabetes Screening**

The second measure of health care quality, diabetes screening, encompasses the percent of diabetic Medicare enrollees receiving HbA1c screening. Regular HbA1c screening among diabetic patients is considered the standard of care. When high blood sugar, or hyperglycemia, is addressed and controlled, complications from diabetes can be delayed or prevented.<sup>137</sup>

The chart shows the trend for diabetes screening is improving slightly nationally but may be decreasing in our service area. The percent of people receiving A1c screening is lower in our service area than in the nation.<sup>138</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Diabetes screening	3	3	3	3	12

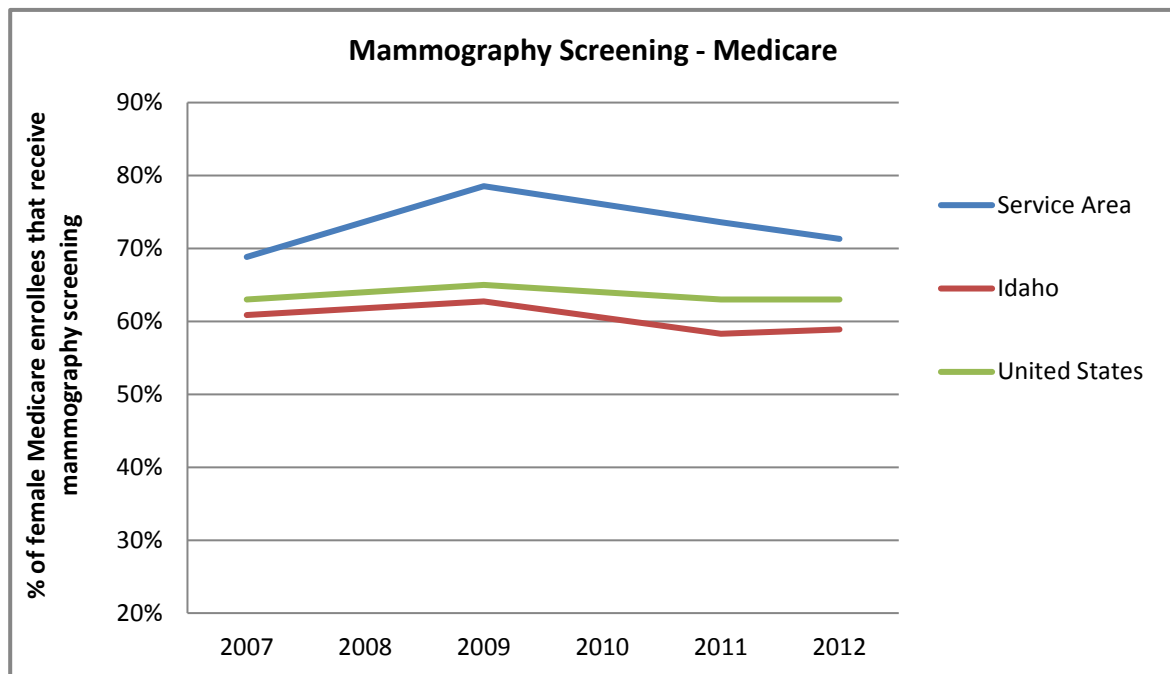

<sup>137</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>138</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

- **Mammography Screening**

The third measure of health care quality, mammography screening, is the percent of female Medicare enrollees age 67-69 having at least one mammogram over a two-year period. Evidence suggests that screening reduces breast cancer mortality, especially among older women. A physician’s recommendation or referral—and satisfaction with physicians—are major facilitating factors among women who obtain mammograms.

In our community, the percent of women aged 67 to 69 receiving mammography screenings is higher than the national average.<sup>139</sup>

The data underlying this measure comes from the Dartmouth Atlas, a project that documents variations in health care throughout the country through use of Medicare claims data.

The National Cancer Institute recommends that women age 40 and older receive screening for breast cancer with mammography every one to two years. To obtain the percentage of Idaho women age 40 and older who received this breast cancer screening, we used data from BRFSS. As shown in the chart on the following page, the percentage has not changed significantly over the past five years. Women with annual incomes of

<sup>139</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2015. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

less than \$25,000 are significantly less likely to have had a mammogram and breast exam in the last two years.<sup>140</sup>

Mammography screening	2	2	4	1	9

### Additional Clinical Health Factors

In this section, we include a number of additional preventive and screening measures as quality of care health factors influencing community health.

- **Cholesterol Screening**

Cholesterol screening is important for good health because knowing cholesterol levels can spur actions to control it. Idaho is ranked 49<sup>th</sup> in the nation for cholesterol screening.<sup>141</sup> Our service area also has a lower percent of people receiving cholesterol checks than the national average.<sup>142</sup>

<sup>140</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>141</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

<sup>142</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<b>Cholesterol Screening</b>	<b>1</b>	<b>3</b>	<b>3</b>	<b>2</b>	<b>9</b>

<sup>143</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

- **Colorectal Screening**

The five-year survival rate of people diagnosed with early localized stage colorectal cancer is 90%. Only 35% of colorectal cancers are detected at the early localized stage. Many organizations are working to raise awareness about the importance of colorectal cancer screening and the serious nature of the disease.

The trend for people receiving colorectal screening has been improving over the past 10 years. The percent of people age 50 and older who never received a colorectal screening in our service area is lower than the nation as a whole.<sup>144</sup>

People with annual incomes of less than \$25,000 are significantly less likely to have ever had a colonoscopy when compared to people with higher incomes or with a college education.<sup>145</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Colorectal Screening	1	1	4	0	6

<sup>144</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

<sup>145</sup> Ibid.

- **Prenatal Care Begun in First Trimester**

Prenatal care measures how early women are receiving the care they require for a healthy pregnancy and development of the fetus. Mothers who do not receive prenatal care are three times more likely to deliver a low birth weight baby than mothers who received prenatal care, and babies are five times more likely to die without that care. Early prenatal care allows health care providers to identify and address health conditions and behaviors that may reduce the likelihood of a healthy birth, such as smoking and drug and alcohol abuse.<sup>146</sup>

As shown in the chart below, more women in our community have historically been receiving early prenatal care than in the nation as a whole. The trend in our service area for receiving early prenatal care has been increasing.<sup>147</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact

<sup>146</sup> America's Health Rankings 2012, [www.americashealthrankings.org](http://www.americashealthrankings.org)

<sup>147</sup> Idaho Vital Statistics Annual Reports, Years 2000 - 2013, National Vital Statistics Report - Deaths: Data 2013

- **Dental Visits**

Oral health is vital to a comprehensive preventive health program. Nearly one-third of all adults in the U.S. have untreated tooth decay, while one in seven adults aged 35 to 44 years has gum disease. This increases to one in every four adults aged 65 years and older. Oral cancers, if caught early, are more responsive to treatment. Annual dental visits are one part of a healthy regimen of oral care.<sup>148</sup>

According to the Behavioral Risk Factor Surveillance System surveys, the percentage of people not receiving preventive dental visits in our service area is about the same as it is in the nation as a whole. The trend appears to have been worsening over the past ten years in our service area.<sup>149</sup>

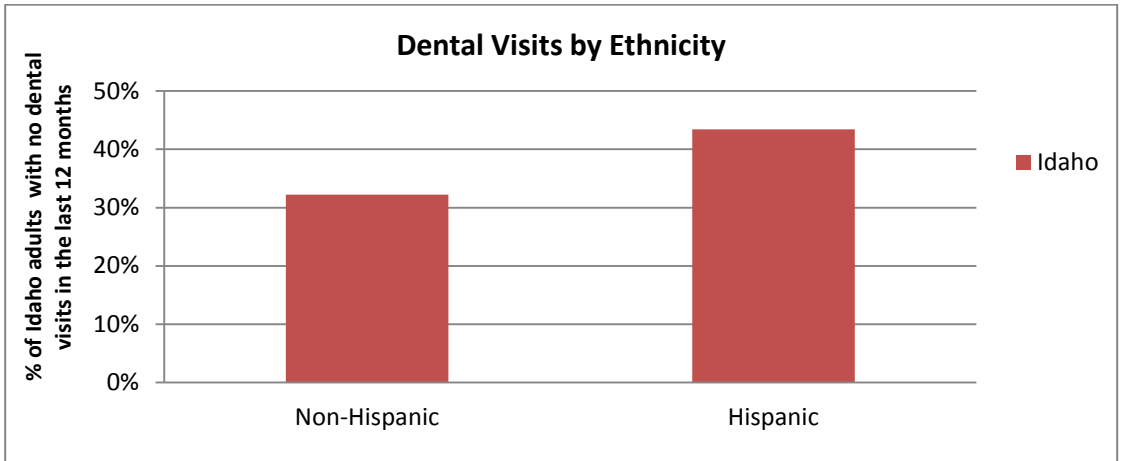

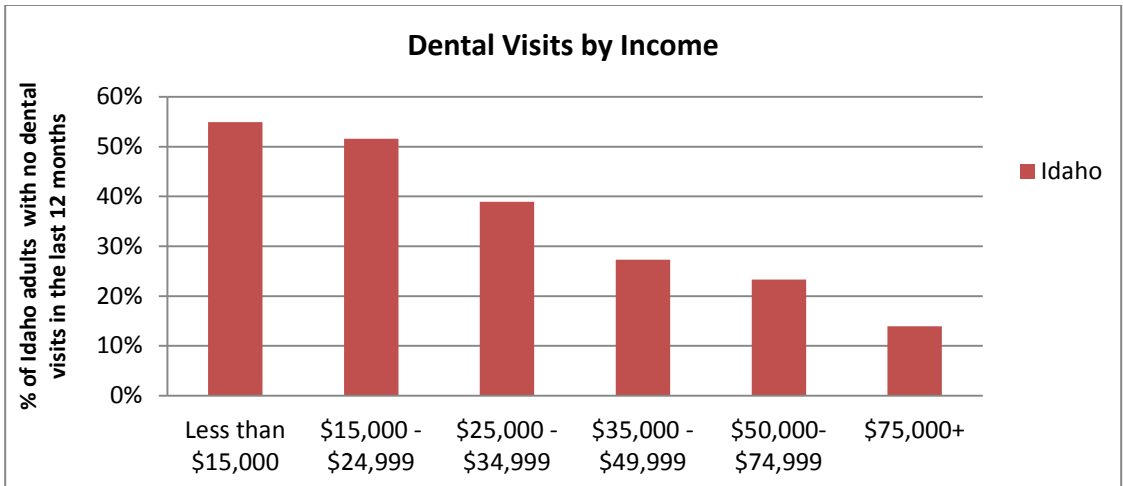

Those with incomes below \$25,000 are significantly less likely to have preventive dental visits than those with higher incomes. In addition, those with less than a college degree are significantly less likely to have preventive dental visits.<sup>150</sup>

<sup>148</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

<sup>150</sup> Ibid.

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Dental Visits	3	2	3	2	10

- **Childhood and Adolescent Immunizations**

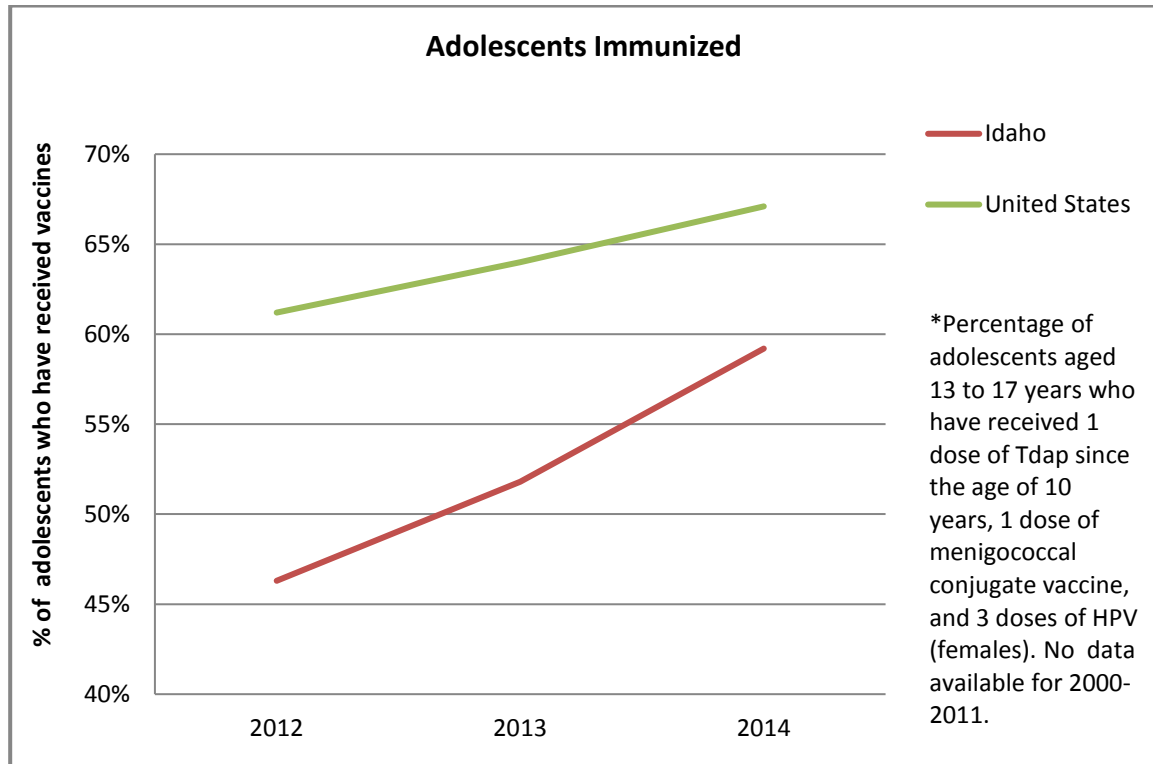

In the U.S., vaccines have reduced or eliminated many infectious diseases that once routinely killed or harmed many infants, children, and adults. However, the viruses and bacteria that cause vaccine-preventable disease and death still exist and can be passed on to people who are not protected by vaccines. Vaccine-preventable diseases have many social and economic costs: sick children miss school and this can cause parents to lose time from work. These diseases also result in doctor's visits, hospitalizations, and even premature deaths.

The immunization coverage measure used here is the average of the percentage of children ages 19 to 35 months who have received the following vaccinations: DTaP, polio, MMR, Hib, hepatitis B, varicella, and PCV. The immunization rate in Idaho has been improving over the past two years and in 2014 was about the same as the national average. In the past, Idaho's immunization rates have often been among the worst in the nation.<sup>151</sup>

<sup>151</sup> America's Health Rankings 2015, [www.americashealthrankings.org](http://www.americashealthrankings.org)

The chart, below, shows the percentage of adolescents aged 13 to 17 years who have received 1 dose of Tdap since the age of 10 years, 1 dose of meningococcal conjugate vaccine, and 3 doses of HPV (females).

While Idaho immunization rates are approximately the same as the national average for children, we are below the national average for adolescents. As children age, immunity from the childhood vaccine DTaP diminishes, and a Tdap booster is needed at age 11 or 12 years to maintain protection against tetanus, diphtheria, and pertussis. This booster provides protection for the immunized teen, as well as those that they come into contact with, which is especially important for infants and the elderly.

There are proven methods to increase the rate of vaccinations that include ways to increase demand or improve access through provider-based innovations.<sup>152</sup>

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S.	Severe/ Preventable	Magnitude: Root Cause	Total Score
Childhood immunizations	1	3	3	2	9

<sup>152</sup> Ibid

- **Mental Health Service Providers**

Blaine County is listed as mental health professional shortage area as of March 2012.<sup>153</sup> Our shortage of mental health professionals is especially concerning given the high suicide and mental illness rates in Idaho as documented in previous sections of our CHNA.

Specifically, the rate of psychiatrists per 100,000 people in Idaho was 5.2 in 2009. This remains the lowest rate of psychiatrists in the nation and less than half of the national average of 11 psychiatrists per 100,000 people. Idaho’s rate of psychologists was 10.7 per 100,000 in 2011, which represented only about one third of the national average of 30.7. The rate of family therapy counselors in Idaho was also below the national average. However, the rate of general counselors and licensed clinical social workers were both above the national average in 2011.<sup>154</sup>

<sup>154</sup> Mental Health, United States, 2012 Report SAMHSA [www.samhsa.gov](http://www.samhsa.gov)

- **Medical Home**

Today's medical home is a cultivated partnership between the patient, family, and primary provider in cooperation with specialists and support from the community. The patient/family is the focal point of this model, and the medical home is built around this center. Care under the medical home model must be accessible, family-centered, continuous, comprehensive, coordinated, compassionate, and culturally effective.<sup>155</sup>

One way to measure progress in the development of the medical home model is to study the percentage of people who do not have one person they think of as their personal doctor. The graph below shows the percentage of people in our service area without a usual health care provider is about the same as the nation as a whole.<sup>156</sup>

## Social and Economic Factors

### *County Health Rankings Social and Economic Factors*

- **Education: High School Graduation and Some College**

Several theories attempt to explain how education affects health outcomes. First, education often results in jobs that pay higher incomes. Access to health care is a particularly important resource that is often linked to jobs requiring a certain level of educational attainment. However, when income and health care insurance are controlled for, the magnitude of education's effect on health outcomes remains substantive and statistically significant.

The labor market environment is also thought to contribute to health outcomes. People with lower educational attainment are more likely to be affected by variations in the job market. Unemployment rates are highest for individuals without a high school diploma compared with college graduates. Evidence shows that the unemployed population experiences worse health and higher mortality rates than the employed population.

Health literacy can help explain an individual's health behaviors and lifestyle choices. There is a striking difference between health literacy levels based on education. Only 3% of college graduates have below basic health literacy skills, while 15% of high school graduates and 49% of adults who have not completed high school have below basic health literacy skills. Adults with less than average health literacy are more likely to report their health status as poor.

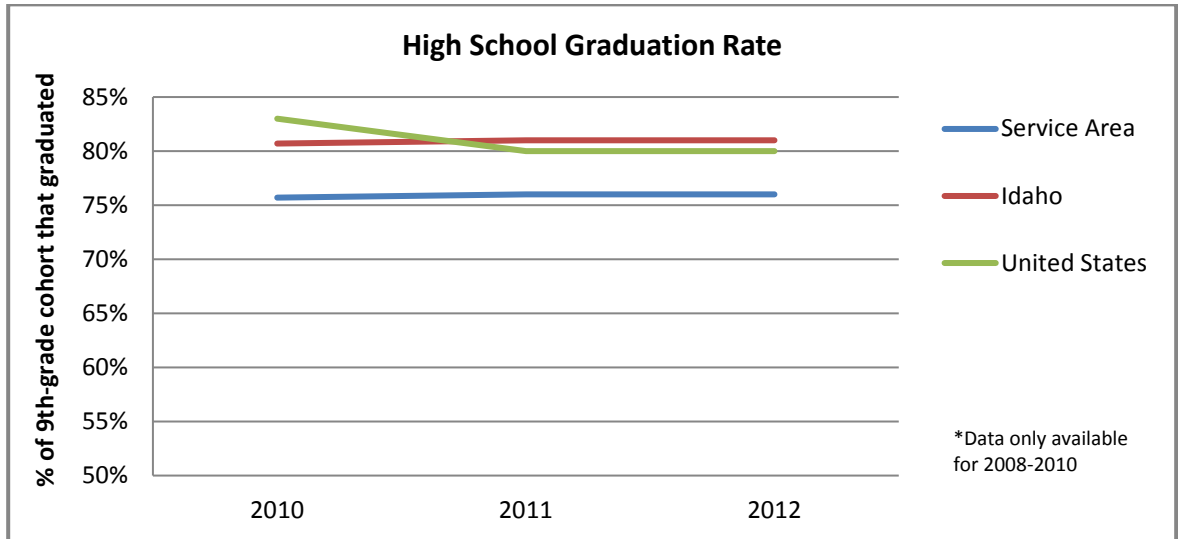

One's education level affects not only his or her health, but education can have multigenerational implications that make it an important measure for the health of future generations. Evidence links maternal education with the health of her children. The education of parents affects their children's health directly through resources available to the children, and also indirectly through the quality of schools that the children attend.

Finally, education influences a variety of social and psychological factors. Evidence shows the more education an individual has, the greater his or her sense of personal control. This is important to health because people who view themselves as possessing a high degree of personal control also report better health status and are at lower risk for chronic disease and physical impairment.

Two measures are used in an attempt to capture the formal years of education within the population. The first measure reports the percent of the ninth grade cohort that graduates high school in four years. The high school graduation data was collected from state Department of Education websites. The second measure reports the percentage of

the population ages 25-44 with some post-secondary education. These data sets are provided by the American Community Survey (ACS).<sup>157</sup>

The high school graduation rate for our community is slightly below the national average. Service area post-secondary education is above the national average.

Health Factor Score

<sup>157</sup> University of Wisconsin Population Health Institute. *County Health Rankings 2012-2015*. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

- **Unemployment**

For the majority of people, employers are their source of health insurance and employment is the way they earn income for sustaining a healthy life and for accessing healthcare. Numerous studies have documented an association between employment and health. Unemployment may lead to physical health responses ranging from self-reported physical illness to mortality, especially suicide. It has also been shown to lead to an increase in unhealthy behaviors related to alcohol and tobacco consumption, diet, exercise, and other health-related behaviors, which in turn can lead to increased risk for disease or mortality.<sup>158</sup>

The unemployment rate in Idaho and our service area has been trending down since 2011 and is approaching the longer term, healthier rates for our area.<sup>159</sup>

<sup>159</sup> National Source: National Bureau of Labor Statistics, [www.bls.gov](http://www.bls.gov). Idaho Source: Idaho Department of Labor [www.bls.gov](http://www.bls.gov)

- **Children in Poverty**

Income and financial resources enable individuals to obtain health insurance, pay for medical care, afford healthy food, safe housing, and access other basic goods. A 1990s study showed that if poverty were considered a cause of death in the United States, it would have ranked among the top 10. Data on children in poverty is used from the Census' Current Population Survey (CPS) Small Area Income and Poverty Estimates (SAIPE).<sup>160</sup>

Although the trend has started to improve, the percent of children in poverty increased substantially since 2008 both nationally and in our service area. The prevalence of children in poverty in Blaine County is well below the national average.<sup>161</sup>

<sup>161</sup> Source: Small Area Income and Poverty Estimates (SAIPE). <http://www.census.gov/did/www/saibe/data/statecounty/data/index.html>

- **Inadequate Social Support and Single-Parent Households**

Evidence has long demonstrated that poor family and social support is associated with increased morbidity and early mortality. Family and social support are represented using two measures: (1) percent of adults reporting that they do not receive the social and emotional support they need and (2) percent of children living in single-parent households.

The association between socially isolated individuals and poor health outcomes has been well-established in the literature. One study found that the magnitude of risk associated with social isolation is similar to the risk of cigarette smoking for adverse health outcomes. The social isolation measure reports the percentage of adults without social/emotional support.<sup>162</sup>

The percent of people with inadequate social support in Blaine County is well below the national average.<sup>163</sup>

Similar to socially isolated individuals, adults and children in single-parent households are at risk for both adverse health outcomes such as mental health problems (including substance abuse, depression, and suicide) and unhealthy behaviors (including smoking and excessive alcohol use). Not only is self-reported health worse among single parents,

<sup>162</sup> University of Wisconsin Population Health Institute. *County Health Rankings* 2012. Accessible at [www.countyhealthrankings.org](http://www.countyhealthrankings.org).

<sup>163</sup> Ibid

but mortality risk also is higher. Likewise, children in these households also experience increased risk of severe morbidity and all-cause mortality.

For our community, the percent of people living in single parent households is well below the national average.<sup>164</sup>

Health Factor Score

	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Inadequate social support	2	1	2	3	8

<sup>164</sup> Ibid

## Community Safety

Injuries through accidents or violence are the third leading cause of death in the United States, and the leading cause for those between the ages of one and 44. Accidents and violence affect health and quality of life in the short and long-term, for those directly and indirectly affected.

Community safety reflects not only violent acts in neighborhoods and homes, but also injuries caused unintentionally through accidents. Many injuries are predictable and preventable; yet about 50 million Americans receive medical treatment for injuries each year, and more than 180,000 die from these injuries.

Car accidents are the leading cause of death for those ages five to 34, and result in over 2 million emergency department visits for adults annually. Poisoning, suicide, falls, and fires are also leading causes of death and injury. Suffocation is the leading cause of death for infants, and drowning is the leading cause for young children.

In 2012, more than 6.8 million violent crimes such as assault, robbery, and rape were committed in the nation. Each year, 18,000 children and adults are victims of homicide and more than 1,700 children die from abuse or neglect. The chronic stress associated with living in unsafe neighborhoods can accelerate aging and harm health. Unsafe neighborhoods can cause anxiety, depression, and stress, and are linked to higher rates of pre-term births and low birth-weight babies, even when income is accounted for. Fear of violence can keep people indoors, away from neighbors, exercise, and healthy foods. Businesses may be less willing to invest in unsafe neighborhoods, making jobs harder to find.

One in four women experiences intimate partner violence (IPV) during their life, and more than 4 million are assaulted by their partners each year. IPV causes 2,000 deaths annually and increases the risk of depression, anxiety, post-traumatic stress disorder, substance abuse, and chronic pain.

Injuries generate \$406 billion in lifetime medical costs and lost productivity every year, \$37 billion of which are from violence. Communities can help protect their residents by adopting and implementing policies and programs to prevent accidents and violence. <sup>165</sup>

---

<sup>165</sup> Ibid.

- **Violent Crime**

Violent crime rates per 100,000 population are included in our CHNA. In the FBI’s Uniform Crime Report, violent crime is composed of four offenses: murder and non-negligent manslaughter, forcible rape, robbery, and aggravated assault. Violent crimes are defined as those offenses which involve force or threat of force.

Violent crime rates in Idaho and our community are significantly better than the national average.<sup>166</sup>

Health Factor Score

## Physical Environment Factors

### County Health Rankings Physical Environment Factors

#### Air and Water Quality

Clean air and water support healthy brain and body function, growth, and development. Air pollutants such as fine particulate matter can harm our health and the environment. Air pollution is associated with increased asthma rates and can aggravate asthma, emphysema, chronic bronchitis, and other lung diseases, damage airways and lungs, and increase the risk of premature death from heart or lung disease. Using 2009 data, the CDC's Tracking Network calculates that a 10% reduction in fine particulate matter could prevent over 13,000 deaths in the US.

A recent study estimates that contaminants in drinking water sicken up to 1.1 million people a year. Improper medicine disposal, chemical, pesticide, and microbiological contaminants in water can lead to poisoning, gastro-intestinal illnesses, eye infections, increased cancer risk, and many other health problems. Water pollution also threatens wildlife habitats.

Communities can adopt and implement various strategies to improve and protect the quality of their air and water, supporting healthy people and environments.<sup>167</sup>

- **Air Pollution Particulate Matter**

Air pollution-particulate matter is defined as the average daily measure of fine particulate matter in micrograms per cubic meter (PM2.5) in a county. Idaho and our service area have air pollution-particulate matter levels below the national average.<sup>168</sup>

<sup>167</sup> Ibid

<sup>168</sup> Ibid

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Air pollution	2	1	2	2	7

- Drinking Water Violations**

The EPA's Safe Drinking Water Information System was utilized to estimate the percentage of the population getting drinking water from public water systems with at least one health-based violation. Our service area has drinking water violation rates that are significantly below the national average.<sup>169</sup>

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Drinking Water Violations	2	0	2	2	6

<sup>169</sup> Ibid

- **Severe Housing Problems**

The U.S. Census Bureau "CHAS" data (Comprehensive Housing Affordability Strategy), demonstrate the extent of housing problems and housing needs, particularly for low income households. There are four housing problems that are tracked in the CHAS data: 1) housing unit lacks complete kitchen facilities; 2) housing unit lacks complete plumbing facilities; 3) household is severely overcrowded; and 4) household is severely cost burdened. A household is said to have a severe housing problem if they have 1 or more of these 4 problems. Severe overcrowding is defined as more than 1.5 persons per room. Severe cost burden is defined as monthly housing costs (including utilities) that exceed 50% of monthly income. <sup>170</sup>

Idaho and our service area in general have a lower percentage of housing problems than the national average.

Health Factor Score					
Low score = Low potential for health impact			High score = High potential for health impact		
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Severe Housing Problems	2	2	1.5	3	9.5

<sup>170</sup> Ibid

- **Driving Alone to Work**

This measure represents the percentage of the workforce that primarily drives alone to work. The transportation choices that communities and individuals make have important impacts on health through active living, air quality, and traffic accidents. The choices for commuting to work can include walking, biking, taking public transit, or carpooling. The most damaging to the health of communities is individuals commuting alone. In most counties, this is the primary form of transportation to work.

The American Community Survey (ACS) is a critical element in the Census Bureau's reengineered decennial census program. The ACS collects and produces population and housing information every year instead of every ten years. The *County Health Rankings* use American Community Survey data to obtain measures of social and economic factors.

Our service area has approximately the same percent of people driving to work alone as the national average.<sup>171</sup>

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Driving Alone to Work	2	2	1	2	7

<sup>171</sup> Ibid

- **Long Commute - Driving Alone**

This measure estimates the proportion of commuters, among those who commute to work by car, truck, or van alone, who drive longer than 30 minutes to work each day. A 2012 study in the American Journal of Preventive Medicine found that the farther people commute by vehicle, the higher their blood pressure and body mass index. Also, the farther they commute, the less physical activity the individual participated in.

Our current transportation system also contributes to physical inactivity—each additional hour spent in a car per day is associated with a 6 percent increase in the likelihood of obesity.

The percent of people in our community with a long commute to work is much lower than the national average.

Health Factor Scoring					
	Trend: Better/Worse	Prevalence versus U.S. Average	Severe/ Preventable	Magnitude: Root Cause	Total Score
Long Commute	2	0	1	2	5

## Community Input

Community input for the CHNA is obtained through two methods:

- First, we conduct in-depth interviews with community representatives possessing extensive knowledge of health and affected populations in our community.
- Second, feedback is collected from community members regarding the 2013 CHNA and the corresponding implementation plan. We use this input to compile and develop the 2016 CHNA. Community members have an opportunity to view our CHNA and provide feedback utilizing the St. Luke's public website.

### Community Representative Interviews

A series of interviews with people representing the broad interests of our community are conducted in order to assist in defining, prioritizing, and understanding our most important community health needs. Many of the representatives participating in the process have devoted decades to helping others lead healthier, more independent lives. We sincerely appreciate the time, thought, and valuable input they provide during our CHNA process. The openness of the community representatives allow us to better explore a broad range of health needs and issues.

The representatives we interview have significant knowledge of our community. To ensure they come from distinct and varied backgrounds, we include multiple representatives from each of the following categories:

**Category I: Persons with special knowledge of public health.** This includes persons from state, local, and/or regional governmental public health departments with knowledge, information, or expertise relevant to the health needs of our community.

**Category II: Individuals or organizations serving or representing the interests of the medically underserved, low-income, and minority populations in our community.** Medically underserved populations include populations experiencing health disparities or at-risk populations not receiving adequate medical care as a result of being uninsured or underinsured or due to geographic, language, financial, or other barriers.

**Category III: Additional people located in or serving our community** including, but not limited to, health care advocates, nonprofit and community-based organizations, health care providers, community health centers, local school districts, and private businesses.

Appendix I contains information on how and when we consulted with each community health representative as well as each individual's organizational affiliation.

## Interview Findings

Using the questionnaire in Appendix II, we asked our community representatives to assist in identifying and prioritizing the potential community health needs. In addition, representatives were invited to suggest programs, legislation, or other measures they believed to be effective in addressing the needs.

The table below summarizes the list of potential health needs identified through our secondary research and by our community representatives during the interview process. Each potential need is scored by the community representatives on a scale from 1 to 10. A high score signifies the representative believes the health need is both important and needs to be addressed with additional resources. Lower scores typically mean the representative believes the need is relatively less important or that it is already being addressed effectively with the current set of programs and services available.

The community representatives' scores are added together and an average is calculated. The average representative score is shown in the second column of the table below. Finally, the representatives' comments as well as suggested solutions regarding each need are summarized in the third column of the table.

Health Behavior Needs		
Potential Health Needs	Average Score	Summary of Community Representatives' Comments
Access to healthy foods	6.0	Blaine County recognizes the importance of access to healthy foods. The community is actively addressing the need. The Hunger Coalition is conducting a comprehensive food assessment. The Idaho Foodbank, Hope Garden, The Sustainability Center, The Connection and Meals on Wheels are a few of the organizations that focus on providing healthy meals to community members. Many note that food is expensive in Blaine County and the focus needs to be on affordability.

<p>Exercise programs/education/opportunities</p>	<p>5.5</p>	<p>The YMCA, Blaine County Recreation Department, YEAH! (Youth Engaged in Activities for Health) and the College of Southern Idaho amongst other organizations offer affordable opportunities for exercise. “There is a need for exercise programs particularly in the Latino Community. Zumba courses and Girls on the Run have been effective in addressing a racially diverse set of athletes.”</p> <p>Suggestions:</p> <ul style="list-style-type: none"> <li>• Provide more Brown Bag Health Talks</li> <li>• “Every single person needs a pedometer and to be walking 10,000 steps a day. We have to engage people.”</li> </ul>
<p>Nutrition Education</p>	<p>5.9</p>	<p>There are a multitude of organizations that offer nutrition education. Community representatives express a need for education geared toward those of low incomes.</p>
<p>Safe sex education programs</p>	<p>6.5</p>	<p>“Not only is there a need for safe sex education, but also a need for education around creating safe relationships/interactions.” Numerous community representatives express the great need for a family practice clinic.</p>
<p>Substance abuse services and programs</p>	<p>8.3</p>	<p>Community representatives at large have strong responses and needs surrounding substance use. “Substance use &amp; abuse is an unfortunate part of the Blaine County culture that needs immediate attention.” “There is a severe lack of services in an area where substance use is high.” The Drug Coalition is very effective, but the demand is extraordinarily high. Specific needs include programs for adolescents, affordable in-patient and out-patient services, addiction counselors and further prevention education.</p>

Tobacco prevention and cessation programs	5.1	There is no shortage of programs and education, yet community members are still observing people using tobacco in addition to e-cigarettes.
Weight management programs	5.9	Representatives express a need for greater assistance, particularly in the Latino population. Many members also believe more physical education classes need to be put back into the school day.
Wellness and prevention programs (for conditions such as high blood pressure, skin cancer, depression, etc.)	7.0	Many recognize an increased need for wellness and prevention programs, especially since the departure of the Idaho Department of Health and Welfare office (Blaine County). Interviewees express needs for affordable programs and for focus on depression. "I see the need for education and support to people self-medicating with various substances. Depression and anxiety is creating a different kind of substance user and abuser that needs addressing."

Clinical Care Access and Quality Needs		
Potential Health Needs	Average Score	Summary of Community Representatives' Comments
Affordable care for low income individuals	8.0	Community representatives feel affordable care is critical. Representatives' list three needs to support creating affordable options: (1) a sliding-scale health clinic, (2) an urgent care facility and (3) expand Medicaid. "People cannot afford wellness and prevention. Subsequently, people reach out for care only when in dire need and use the emergency room."

Affordable dental care for low income individuals	7.7	<p>“The status of your mouth is a sign of one’s socio economic status. It’s a direct sign of the have and have-nots. There needs to be an even playing field and affordable access to dental care.” Many community representatives’ report that there are very limited or no options available for affordable dental care in Blaine County.</p>
Affordable health insurance	7.7	<p>Community representatives are split with regard to their thoughts on the effectiveness of the Affordable Care Act. For some, the cost is very high and they are taking on a high deductible plan or opting out and paying the penalty. Others believe that the program has helped at least marginally. Most express that there remains a great need for affordable health insurance. “Since the Affordable Care Act was enacted, there have been a significant number of patients that are now able to get care. However, there is still a huge need for insurance coverage.” Seasonal employees typically earn low incomes and are under-insured or uninsured.</p>
Availability of behavioral health services (providers, suicide hotline, etc.)	7.4	<p>“This is a glaring deficiency for Idaho.” Interviewees report that the availability of behavioral health services has improved since opening the St. Luke’s Mental Health Services in Hailey, Idaho. The National Alliance on Mental Illness also offers support and programs. There is a concern that the limited services available in the community are over capacity. There is a need for an additional psychiatrist in the county. Numerous representatives express the need for a behavioral health professional that specializes in working with adolescents.</p>

Availability of primary care providers	5.4	Many have seen improvements and are satisfied with the availability of primary care providers in the area. Some still see providers struggle to take walk-in patients and service the entire community. Numerous interviewees comment that physician and medical staff retention is a challenge in their region.
Chronic disease management programs	5.9	<p>“The need requires acknowledgement with the onset growth of the aging population.” Some community representatives are seeing a moderate need. Raising funding for diabetes is very difficult since Blaine County diabetes rates are lower than the national average.</p> <p>Suggestion:</p> <ul style="list-style-type: none"> <li>• “Idaho Home Health previously offered a nail &amp; foot care clinic 4 hours a month. It is no longer offered and would be of great value”.</li> </ul>
Immunization programs	5.0	Immunization opportunities are available. Some programs are offered for free. Community representatives express that there is still a need for further education to the public.
Improved health care quality	4.6	People are generally very satisfied with the level of care they are receiving in Blaine County. The only concern to report is the difficulty accessing specialty care.

<p>Integrated, coordinated care (less fragmented care)</p>	<p>6.8</p>	<p>Providing health care in a rural community can be challenging; integration is critical. “There is often not the health expertise doctors and patients need within the Wood River region. The medical staff relies on gathering information from specialists outside of town via phone and email which delays care to the patient.” Patients are seeing needs for greater collaboration specifically between the hospital and in-home care providers, the hospital and social services and for offering care to those who speak limited English.</p> <p>Suggestions:</p> <ul style="list-style-type: none"> <li>• Provide health coaches/ health navigators to those who require added assistance.</li> <li>• Provide cross-training opportunities between hospital employees and social services. Community professionals need to collaborate and have knowledge of the available resources.</li> </ul>
<p>Prenatal care programs</p>	<p>4.7</p>	<p>Overall, people are satisfied with the quality and availability of prenatal care programs. Numerous interviewees mention a need for an additional OBGYN physician in the area.</p> <p>Suggestion:</p> <ul style="list-style-type: none"> <li>• Provide prenatal courses in Spanish.</li> </ul>

<p>Screening programs (cholesterol, diabetic, mammography, etc.)</p>	<p>4.3</p>	<p>There are screening programs available to the community and most believe the screening programs receive good participation. Mammography screenings and the <i>Heart of the Matter</i> cholesterol and glucose screenings are two popular opportunities.</p> <p>Suggestion:</p> <ul style="list-style-type: none"> <li>• The marketing could be improved by specifying what ages and populations particular conditions affect. “People are not necessarily understanding what the screenings are for and their significance.”</li> </ul>
--	------------	--

<p><b>Social and Economic Needs</b></p>		
<p><b>Potential Health Needs</b></p>	<p><b>Average Score</b></p>	<p><b>Summary of Community Representatives' Comments</b></p>
<p>Children and family services</p>	<p>7.0</p>	<p>Various needs are expressed for children and family services. “The effects of Idaho Health &amp; Welfare pulling out of Blaine County has been detrimental.” The most frequent needs expressed are for a family planning clinic and for affordable childcare during and after school. Interviewees also noted the need for more Spanish taught courses, parenting classes and for Child Protective Services in Blaine County.</p> <p>Suggestion:</p> <ul style="list-style-type: none"> <li>• The <i>Nurse Planning Partnership</i> (NFP) out of Denver, Colorado is an effective program that could be a good match to meet some of Blaine County’s needs. Nurses conduct home visitations to improve pregnancy outcomes, child health and development and to encourage self-sufficiency for first-time parents.</li> </ul>

Disabled services	5.5	The community offers various excellent programs such as <i>Higher Ground</i> , <i>Special Olympics</i> and <i>Swiftsure Ranch</i> . Still there is a need for improved sidewalks, transportation and opportunities particularly for adults during the daytime.
Early learning before kindergarten (such as a Head Start type program)	4.8	Numerous interviewees report that they don't necessarily see a need to prioritize early childhood education or assign significant value. There are a few community representatives who are big believers in offering pre-kindergarten programs. "Addressing this need would allow for the biggest bang for our buck and be the biggest difference maker. 50% of children are not prepared for kindergarten."
Education: Assistance in achieving good grades in kindergarten through high school	6.2	The responses are mixed with regard to the quality of education students are receiving and their achievement levels. "There is a greater need for focus on the love for learning and achieving a good self-esteem." The Lee Pesky Learning Center, YMCA and Blaine County Recreation District all offer further support to kids in the community.
Education: College education support and assistance programs	5.3	Support is available to students seeking further education. The 'I Have a Dream' program offers substantial scholarship. The College of Southern Idaho offers associate degrees and scholarships. There is also a school district counselor who is dedicated to college and career guidance. Community representatives express the need to focus on the Latino population, specifically to encourage and empower Latino females.
Elder care assistance (help in taking care of older adults)	6.7	Many note that Blaine County has a significant aging population and long term

		<p>care is a need. There are assisted living opportunities, if one can afford it. Needs have been expressed for more in-home care providers and affordable assisted living options. <i>The Connection</i> has multiple programs to improve the quality of life for seniors, but it is challenged by lack of funding.</p> <p>Suggestions:</p> <ul style="list-style-type: none"> <li>• Create a support group for caregivers.</li> <li>• Conduct a class and support group for people and families suffering through Alzheimer’s and dementia</li> </ul>
End of life care or counseling (care for those with advanced, incurable illness)	4.8	<p>Most agree that hospice is doing an exceptional job and addresses the need for end of life care and counseling. One community representative notes the high cost associated with the final months of life and that the approach needs to change.</p>
Homeless services	7.3	<p>Blaine County can offer limited, short-term resources for the homeless population. Otherwise, people without shelter are sent to Twin Falls to gain assistance. Numerous community representatives express a need for a small shelter, especially for men.</p>
Job training services	6.1	<p>‘Wood River Works’ and ‘Skills for Success’ are two job training programs that interviewees recognize as effective and great for the community. Some express a need for more programs like these specifically for adults, those with a disability, those not continuing onto college and for the Latino population.</p>
Legal Assistance	5.9	<p>Certain populations of people have access to subsidized legal advice, but the majority do not. People who cannot afford an</p>

		attorney must travel to Twin Falls for the nearest Legal Aid office.
Senior services	5.3	'The Connection' offers multiple programs and services to older adults in the Wood River Valley. It is a constant challenge to raise funding for senior services. Transportation for seniors is an ongoing need.
Veterans' services	6.1	Historically, veterans had to travel outside of Blaine County to receive care. The 'Veterans Choice Program' now allows eligible veterans the ability to receive care locally from non-VA facilities. There is a need for more education around this opportunity. Affordable housing is also a need for veterans.
Violence and abuse services	5.1	Many community representatives comment and recognize the great value 'The Advocates' provide to the community. A few interviewees express the need for education and treatment services for perpetrators.

Physical Environment Needs		
Potential Health Needs	Average Score	Summary of Community Representatives' Comments
Affordable housing	7.8	Affordable housing rates as one of the top needs in Blaine County. Interviewees note that the Wood River Valley is an expensive place to live and the demand for affordable housing surpasses the limited supply. Community members are seeing multiple families in one apartment unit. They express a need for single-family

		homes spread throughout the community in order to create healthy environments. 'Advocates for Real Community Housing Community Housing Trust' (ARCH) continues to develop and provide affordable housing to those of low income.
Healthier air quality, water quality, etc.	2.9	Community representatives in the Wood River Valley appreciate the environment they live in. Some express concern regarding water supply for upcoming seasons.
Healthy transportation options (sidewalk, bike paths, public transportation)	4.7	<p>Community members are proud of the extensive bike path systems provided in the valley. Many note that walkability and sidewalks need improvement in some areas, especially where kids are walking to school. There is a need for access to public land for hikers and pedestrians.</p> <p>"Currently, there are private pieces of land surrounding public space which limits the access."</p> <p>Mountain Rides promotes and provides public transportation via bus, van pool, car pool and bike share programs. Some representatives express the need for improved routes in Haley, Idaho and subsidized pricing for low-income community members.</p>
Transportation to and from appointments	6.0	<p>Interviewees report there are bus stops in front of St. Luke's Wood River Medical Center and various clinics around the valley. The challenge can be getting patients to and from the bus stops. Patients particularly have a need for transportation to Twin Falls and Boise when seeking specialized care.</p> <p>Suggestion:</p> <ul style="list-style-type: none"> <li>• Provide van transportation once to twice a week for patients to Twin Falls.</li> </ul>

### **Utilizing community representative input**

The community representative interviews are used in a number of ways. First, our representatives' input ensures a comprehensive list of potential health needs is developed. Second, the scores provided are an important component of the overall prioritization process. The community representative need score is weighted with more than twice as many points (10 points) as the individual health factor data scores for magnitude, severity, prevalence, or trend. Therefore, the representative input has significant influence on the overall prioritization of the health needs.

There are a number of reoccurring themes that frame the way community representatives believe we can improve community health. These themes act as some of the underlying drivers for the way representatives select and score each potential health need. A summary of some of these themes is provided below.

### **Emphasis on prevention vs. disease management**

Many of the community representatives strongly believe that prevention is the most effective approach to improving community health and wellness. For items such as obesity, tobacco use and substance abuse, they recommend allocating resources to youth education and other prevention oriented programs. In contrast, many representatives see great value in helping people stabilize their current chronic condition(s) in order to improve health. They believe providing chronic disease management resources is the most effective route to improved health for the community at large.

### **The impact of added community resources vs. behavioral choice**

Numerous representatives believe that added social services, medical resources and/or improved physical environment are the best ways to address people in need. For example, they believe low-cost children's services, greater access to exercise opportunities, additional psychiatrists and an improved transportation system would help raise the level of health and wellness in the community. However, there are a significant number of people who believe that regardless of how many opportunities are made available, improving health often comes down to personal choice. Added programs provide little benefit unless individuals are ready to make healthy choices and invest in their own health.

### **Hub vs. rural locations**

Not surprisingly, residents who live near a hospital and other major facilities respond differently than those who live in rural areas and have to make considerable efforts to seek care. Some residents who live in rural areas expect and advocate for more resources to improve and grow their communities. Others believe that limited services are inherent to living in a relatively smaller town.

These perspectives demonstrate the complexity and intricacies of community health. There is wisdom to be gained by listening and carefully reviewing each of the philosophies and experiences shared in the interviews. We invite further input from community members by

visiting the St. Luke's public web page and submitting your thoughts. St. Luke's highly values your feedback and will consider the insights provided to shape and implement future change.

## Community Health Needs Prioritization

This section combines the community representative need scores with the health factor scores to arrive at a single, ranked set of health needs and factors. The more points a combined health need and factor receive, the higher the overall priority. The process for combining the representative and health factor scores is described in the steps below.

### 1. Matching Health Needs to Related Health Factors

First, each health representative need is matched to one or more health factors or outcomes. For example, the health need “wellness and prevention programs” is matched to related health outcomes such as diabetes, heart disease, and high blood pressure.

### 2. Combining the Community Leader and Health Factor Scores to Rank the Needs

Next, the community representative score is added to its related health factor score to arrive at a combined total score. This process effectively utilizes both the community representative information and the secondary health factor data to create a transparent and balanced approach for prioritization. The community representative score represents insights based on direct community experience while the health factor score provides an objective way to measure the potential impact on population health.

The combined results offer information relevant to determining what specific kinds of programs have the greatest potential to improve population health. For instance, if the total score for wellness programs for diabetes is 21 and the total score for wellness programs for arthritis is only 12, it becomes clear that wellness and prevention programs for diabetes have a higher potential population health impact. Combining the representative and health factor scores can also help prioritize adult versus teen needs allowing us to build programs for the most affected population groups.

Out of the over 60 health needs and factors we analyze in our CHNA, five have scores of 18.9 or higher. These health needs represent **the top 10<sup>th</sup> percentile and are considered to be our significant, high priority health needs**. These high priority needs are highlighted in dark orange in the summary tables found on the following pages. A total of eight health needs have scores of 17.7 or higher representing the top 15<sup>th</sup> percentile. We highlighted these in the lighter shade of orange to make it easy to identify the next level of high ranking needs.

The summary tables provide each health need’s prioritization score as well as demographic information about the most affected populations. Demographic data defining affected populations is important because it tells us when people with low incomes, no college education, or ethnic minorities suffer disproportionately from specific health conditions or from barriers to health care access.

## Health Behavior Category Summary

Our community’s high priority needs in the health behavior category are wellness and prevention programs for mental illness, suicide, substance abuse, and obesity. Our community health representatives provided relatively high scores for these needs. In addition, obesity ranks as high priority needs because it is trending higher and is a contributing factors to a number of other health concerns. Mental illness also ranks high because Idaho has one of the highest percentages of any mental illness (AMI) in the nation.

Some populations are more affected by these health needs than others. For example, people with lower income and educational levels in our community have higher rates of obesity.

**Health Behavior Needs Summary Table**

<i>Table Color Key</i>	
<i>Dark Orange = High priority ( total score in the top 10<sup>th</sup> percentile)</i>	
<i>Light Orange = ( total score in the top 15<sup>th</sup> percentile)</i>	
<i>White = Total score below the 15<sup>th</sup> percentile</i>	

<b>Identified Community Health Needs</b>	<b>Related Health Factors and Outcomes</b>	<b>Populations Affected Most*</b>	<b>Total Score</b>

	Respiratory disease		13
	Skin cancer		17

\* Information on affected populations included in table when known.

## Clinical Care Category Summary

High priority clinical care needs include: Affordable health insurance and increased availability of behavioral health services. Both were ranked as top health needs by our community representatives. In addition, affordable health insurance ranks as a top priority need because our service area has a high percentage of people who are uninsured. Availability of behavioral health services also ranked as a top priority because Idaho has a shortage of behavioral health professionals.

As shown in the table below, high priority clinical care needs are often experienced most by people with lower incomes. In addition, a number of our community leaders expressed concern about people just above the poverty level who are left without health insurance because they don't qualify for Medicaid.

**Clinical Care Needs Summary Table**

<i>Table Color Key</i>	
<i>Dark Orange = High priority ( total score in the top 10<sup>th</sup> percentile)</i>	
<i>Light Orange = ( total score in the top 15<sup>th</sup> percentile)</i>	
<i>White = Total score below the 15<sup>th</sup> percentile</i>	

<b>Identified Community Health Needs</b>	<b>Related Health Factors and Outcomes</b>	<b>Populations Affected Most*</b>	<b>Total Score</b>
Affordable health insurance	Uninsured adults	Income < \$50,000, Hispanic, No college	19.7
Availability of behavioral health services (providers, suicide hotline, etc)	Mental health service providers	Income < \$50,000	19.4
Affordable care for low income individuals	Children in poverty	Income < \$50,000, Age < 19	18
Affordable dental care for low income individuals	Preventative dental visits		17.7

**Clinical Care Needs Summary Table, Continued**

<b>Identified Community Health Needs</b>	<b>Related Health Factors and Outcomes</b>	<b>Populations Affected Most*</b>	<b>Total Score</b>
Availability of primary care providers	Primary care providers		14.4
Chronic disease management programs	Arthritis	Income < \$35,000, Non-Hispanic, No college, Overweight, Age 65 +	9.9
	Asthma	Income < \$35,000	10.9
	Diabetes	Income < \$50,000, No high school diploma	16.9
	High blood pressure	Income < \$35,000, No college, Overweight, Age 65 +	12.9
Immunization programs	Children immunized		14
	Adolescents immunized		14
	Flu/pneumonia		10
Improved health care quality	Preventable hospital stays		11.6
Integrated, coordinated care (less fragmented care)	No usual health care provider		15.8
	Preventable hospital stays	Refugees, Hispanics, Age 65 +	13.8
Prenatal care programs	Prenatal care 1st trimester	Hispanic, No high school diploma	12.7
	Low birth weight		14.7
Screening programs (cholesterol, diabetic, mammography, etc)	Cholesterol screening	Income < \$35,000, No high school diploma, Age 55 +	13.3
	Colorectal screening	Income < \$35,000, No college, Age 50 +	10.3
	Diabetic screening		16.3
	Mammography screening	Income < \$50,000	13.3

\* Information on affected populations included in table when known.

## Social and Economic Factors Category Summary

Children and family services for low-income populations is the highest ranking social and economic factor. The number of children living in poverty in our service area drives this need.

**Social and Economic Needs Summary Table**

<i>Table Color Key</i>	
<i>Dark Orange = High priority ( total score in the top 10<sup>th</sup> percentile)</i>	
<i>Light Orange = ( total score in the top 15<sup>th</sup> percentile)</i>	
<i>White = Total score below the 15<sup>th</sup> percentile</i>	

<b>Identified Community Health Needs</b>	<b>Related Health Factors and Outcomes</b>	<b>Populations Affected Most*</b>	<b>Total Score</b>
Children and family services	Children in poverty	Income < \$35,000	16
	Inadequate social support		15
Disabled services *			13.5
Early learning before kindergarten (such as a Head Start type program)	High school graduation rate		13.8
Education: Assistance in achieving good grades in kindergarten through high school	High school and college education rates		15.2
Education: College education support and assistance programs	High school and college education rates		14.3
Elder care assistance (help in taking care of older adults)			14.7
End of life care or counseling (care for those with advanced, incurable illness)			12.8

### Social and Economic Needs Summary Table, Continued

Identified Community Health Needs	Related Health Factors and Outcomes	Populations Affected Most*	Total Score
Homeless services	Unemployment rate		14.3
Job training services	Unemployment rate		13.1
Legal assistance			13.9
Senior services	Inadequate social support	Age 65 +	13.9
Veterans' services	Inadequate social support		14.1
Violence and abuse services	Violent crime rate		11.1

\* Information on affected populations included in table when known.

## Physical Environment Category Summary

In the physical environment category, affordable housing had the highest ranking. Affordable housing received a relatively high score from our community representatives.

**Physical Environment Needs Summary Table**

<i>Table Color Key</i>	
<i>Dark Orange = High priority ( total score in the top 10<sup>th</sup> percentile)</i>	
<i>Light Orange = ( total score in the top 15<sup>th</sup> percentile)</i>	
<i>White = Total score below the 15<sup>th</sup> percentile</i>	

<b>Identified Community Health Needs</b>	<b>Related Health Factors and Outcomes</b>	<b>Populations Affected Most*</b>	<b>Total Score</b>
Affordable housing	Severe housing problems	Income < \$50,000	17.3
Healthier air quality, water quality, etc	Air pollution particulate matter		9.9
	Drinking water violations		8.9
Healthy transportation options (sidewalk, bike paths, public transportation)	Long commute		9.7
	Driving alone to work		11.7
Transportation to and from appointments		Income < \$35,000, Rural populations, Age 65 +	14

\* Information on affected populations included in table when known.

## Significant Health Needs

We analyze over 60 potential health needs and health factors during our CHNA process. Measurably improving even one of these health needs across our entire community's population requires a substantial investment in both time and resources. Therefore, we believe it is important to focus on the needs having the highest potential to positively impact community health. Using our CHNA process, health needs with the highest potential to improve community health are those needs ranking in the top 10<sup>th</sup> percentile of our scoring system. The following needs rank in the top 10<sup>th</sup> percentile:

- Prevention and management of substance abuse
- Prevention and management of mental illness
- Availability of behavioral health services
- Prevention of suicide
- Prevention and management of obesity for children and adults
- Affordable health insurance

After identifying the top ranking health needs, we organize them into groups that will benefit by being addressed together as shown below:

Group #1: Improve Mental Health and Reduce Suicide and Substance Abuse

Group #2: Improve the Prevention and Management of Obesity

Group #3: Improve Access to Affordable Health Insurance

We call these groups of high ranking needs our “significant health needs” and provide a description of each of them next.

## Significant Health Need #1: Improve Mental Health and Reduce Suicide and Substance Abuse

Improving mental health and reducing suicide and substance abuse rank among our most significant health needs. This is because our community representatives scored mental health, the availability of behavioral health providers, and substance abuse as some of our most significant health needs. In addition, Idaho has one of the highest percentages (23.3%) of any mental illness (AMI) in the nation, shortages of mental health professionals in all counties across the state, and suicide rates that are consistently higher than the national average. Depression is the most common type of mental illness, affecting more than 26% of the U.S. adult population. It has been estimated that by the year 2020, depression will be the second leading cause of disability throughout the world. Further, the percent of people who report using illicit drugs in our service area is more than twice as high as Idaho as a whole.

### Impact on Community

Good mental health is “a state of well-being in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community.” It is estimated that only about 17% of U.S adults are considered to be in a state of optimal mental health.<sup>172</sup>

Reducing drug abuse can have a positive impact on society on multiple levels as well. Directly or indirectly, every community is affected by drug abuse and addiction, as is every family. This includes health care expenditures, lost earnings, and costs associated with crime and accidents. This is an enormous burden that affects all of society - those who abuse these substances, and those who don't. Families can be destroyed by drug abuse. Approximately 50% to 80% of all child abuse and neglect cases substantiated by child protective services involve some degree of substance abuse by the child's parents.<sup>173</sup> It is estimated that in 2007 illicit drug use cost the U.S. economy more than \$193 billion. The cost of illegal drug use is similar to government estimates on the cost of diabetes.<sup>174</sup>

### How to Address the Need:

There is a high prevalence of comorbidity between drug use disorders and other mental illnesses. The high rate of comorbidity argues for a comprehensive approach to intervention that identifies and evaluates each disorder concurrently, providing treatment as needed.<sup>175</sup>

The majority of adults who live with a mental health disorder do not get corresponding treatment. Furthermore, less than one-third of adults get minimally adequate care.<sup>176</sup>

---

<sup>172</sup> <http://www.cdc.gov/mentalhealth/basics.htm>

<sup>173</sup> <http://archives.drugabuse.gov/about/welcome/aboutdrugabuse/magnitude/>

<sup>174</sup> The Economic Impact of Illicit Drug Use on American Society, Department of Justice's National Drug Intelligence Center (NDIC).

<sup>175</sup> <http://www.drugabuse.gov/publications/research-reports/comorbidity-addiction-other-mental-illnesses/how-can-comorbidity-be-diagnosed>

<sup>176</sup> Substance Abuse and Mental Health Services Administration, Behavioral Health Report, United States, 2012 pages 29 - 30

Stigma surrounding the receipt of mental health care is among the many barriers that discourage people from seeking treatment.<sup>177</sup> In addition, increasing physical activity and reducing obesity are also known to improve mental health.<sup>178</sup>

Therefore, our aim is to work with our community to reduce the stigma around seeking mental health treatment, to improve access to behavioral health services, increase physical activity, and reduce obesity especially for our most affected populations.

**Affected Populations:**

People with lower incomes are about three and a half times more likely to have depressive disorders.<sup>179</sup> Illicit drug use is significantly higher among males less than 34 years old, the unemployed, and those with incomes of less than \$50,000 annually.<sup>180</sup>

<sup>179</sup> Idaho 2011 - 2013 Behavioral Risk Factor Surveillance System

<sup>180</sup> Idaho and National 2002 - 2013 Behavioral Risk Factor Surveillance System

## Significant Health Need #2: Improve the Prevention and Management of Obesity

Our CHNA prioritization process identified prevention and management of obesity as one of our community's most significant health needs. Over 50% of the adults in our community are now obese or overweight. According to the Centers for Disease Control (CDC): "Obesity is a national epidemic and a major contributor to some of the leading causes of death in the United States." Obesity costs the United States about \$150 billion a year, or 10 percent of the national medical budget.<sup>181</sup>

### Impact on Community

Reducing obesity will dramatically impact community health by providing an immediate and positive effect on many conditions including mental health; heart disease; some types of cancer; high blood pressure; dyslipidemia; kidney, liver and gallbladder disease; sleep apnea and respiratory problems; osteoarthritis; and gynecological problems (infertility and abnormal menses).

### How to Address the Need

Obesity can be prevented and managed by engaging our community in developing services and policies designed to encourage proper nutrition and healthy exercise habits. Obesity can also be managed through evidence-based clinical programs.<sup>182</sup>

Extremely promising outcomes are now being reported in some communities. Remarkably, from 2011 through 2014, Lee County, Florida, reduced adult obesity levels from 29.3% to 24.8% and childhood obesity dropped from 31.6% to 20.7%. These results were accomplished through extensive community leadership and involvement. A Lee Memorial Hospital representative commented: "We believe these improvements can be sustained and improved further."<sup>183</sup> Echoing this approach, the CDC states that "we need to change our communities into places that strongly support healthy eating and active living."<sup>184</sup>

### Affected Populations

Some populations are more affected by these health needs than others. For example, low income individuals and those without college degrees have significantly higher rates of obesity.

<sup>184</sup> <http://www.cdc.gov/cdctv/diseaseandconditions/lifestyle/obesity-epidemic.html>

## Significant Health Need #3: Improve Access to Affordable Health Insurance

Barriers to access are issues that prevent people from receiving timely medical care. They include things such as the lack of transportation to doctors' appointments, the availability of health care providers, and the cost of care. Our CHNA process identified the following high ranking barrier to access:

- Affordable health insurance

The health indicator data and community representative scores have ranked this barrier to access as one of our community's most significant health needs. A recent study showed that nearly 19 percent of U.S. adults do not receive medical care or delay medical care because they are concerned about the cost or worried that their health insurance would not pay for treatment.<sup>185</sup>

### **Impact on community:**

Improving access to affordable health insurance can make a remarkable difference to community health. According to the Gallup-Healthways Well-Being Index, Americans in poverty are significantly more likely than those who are not to struggle with a wide array of chronic mental and physical health problems.<sup>186</sup> Further, evidence shows that uninsured individuals experience more adverse outcomes (physically, mentally, and financially) than insured individuals. The uninsured are less likely to receive preventive and diagnostic health care services, are more often diagnosed at a later disease stage, and on average receive less treatment for their condition compared to insured individuals. At the individual level, self-reported health status and overall productivity are lower for the uninsured. The Institute of Medicine reports that the uninsured population has a 25% higher mortality rate than the insured population.<sup>187</sup>

### **How to Address the Need:**

We will work with our community to improve access to affordable health insurance options.

### **Affected populations:**

Statistics show that people with lower income and education levels and Hispanic populations are much more likely not to have health insurance.<sup>188</sup>

## Implementation Plan Overview

St. Luke's will continue to collaborate with the people, leaders, and organizations in our community to carry out an implementation plan designed to address many of the most pressing community health needs identified in this assessment. Utilizing effective, evidence-based programs and policies, we will work together to improve community health outcomes and well-being toward the goal of attaining the healthiest community possible.

## Future Community Health Needs Assessments

We intend to reassess the health needs of our community on an ongoing basis and conduct a full community health needs assessment once every three years. St. Luke's next Community Health Needs Assessment is scheduled to be completed in 2019.

## History of Community Health Needs Assessments and Impact of Actions Taken

In our 2013 CHNA, St. Luke's Wood River identified 4 groups of significant health needs facing individuals and families in our community. Each of these groups is shown below, along with a description of the impact we have had on addressing these needs over the past three years.

### **Group 1: Behavioral Health and Substance Abuse Services and Programs**

Programs for mental illness, availability of mental health service providers, and substance abuse were identified as high priority community health needs. Suicide prevention was ranked above the median. We grouped the programs designed to serve these needs together because we believe they reinforce one another.

From on-going free mental health screenings to a new behavioral health clinic, St. Luke's Wood River is helping to provide much-needed access to care for people with mental and behavioral health needs in our community.

Over the past three years, St. Luke's Wood River Family Medicine has continued to screen its patients for depression, because early detection can result in decrease of acuity, patients can receive more appropriate and effective treatment, and ED visits and hospitalizations can be decreased. In addition, our primary care physicians are taking a more active role in the treatment of mental health conditions. Six of our primary care physicians attended a REACH (Resources for Advancing Children's Health) course, which is a three-day, intensive, integrative training for primary care providers that covers assessment, diagnosis, treatment and medication management for a variety of mental health conditions, including depression, anxiety, aggression, bi-polar and psychosis.

With the support of our mental health professional team at St. Luke's Clinic – Mental Health Services we trained all patient access and nursing staff at all our clinics (primary care, neurology, rehab, ob/gyn, orthopaedics, dermatology) on a suicide protocol to assist them in properly responding to suicidal patients. Additionally, our mental health team regularly provides community education about mental health and suicide prevention in a variety of settings – school, community, hospital.

### **St. Luke's Clinic – Mental Health Services**

In October 2013, St. Luke's Wood River opened St. Luke's Clinic – Mental Health Services, providing a full spectrum of mental health services with a clinical team consisting of a full-time psychiatrist, 2 mental health therapists, and a nurse. We provide consultation, co-management, diagnostic, and multidisciplinary mental health services in close coordination with our primary care physicians and community-based therapists. Since its inception we have served over 1,000 patients in the clinic.

### **Counseling Scholarship Fund**

During the past 3 years we have continued to offer our Counseling Scholarship Fund, a program that provides funding and facilitates access to community-based mental health counseling for uninsured and underinsured individuals and families. This scholarship fund helps offset the high costs of community-based mental health counseling for people in need. These critical counseling sessions help address a wide range of mental health issues including suicide, parenting, anxiety, and depression. In 2014 and 2015 we served 143 people with this fund.

### **Mental Health Services Scholarship Fund**

Additionally, in 2016 we began our Mental Health Services Scholarship Fund, a program that provides funding for patients seeking psychiatric or counseling services at St. Luke's Clinic – Mental Health Services who are uninsured and underinsured. We have patients who report reducing the number of visits to our therapists or psychiatrist for lack of ability to afford their services and some who have stopped coming for care for this reason. We hope to reduce the number of patients who chose to stop receiving services and help others maintain the recommended care plan from their provider by providing them the funds to do so. Since the scholarship began we have assisted 8 patients in receiving care through the clinic. While the patients mental health services are being covered, staff start the process of connecting the patient with St. Luke's Patient Financial Services to create a more long-term, sustainable funding source for the patient. This may include Medicaid, a St. Luke's Financial Care Plan, or Social Security Disability.

### **Car Seat Safety Checks**

Certified child passenger safety technicians install car seats before newborns are discharged from the medical center, fit older children to their seats, teach proper installation, and check for recalls. We offer monthly scheduled car seat checks or people

can call for individual checks. We expect that properly fitting children to car seats prevents unnecessary injuries from car accidents. We do not allow an infant to leave the medical center after birth without a properly installed car seat. We properly fitted over 350 car seats from 2013 – 2015.

## **Group 2: Weight Management/Fitness Programs Ranked as High Priority**

Adult and teen weight management programs were ranked as high priority health needs. According to the CDC, the key to achieving and maintaining a healthy weight is about a lifestyle that includes healthy eating, regular physical activity, and balancing the number of calories you consume with the number of calories your body uses. Therefore, our weight management programs include physical activity and nutrition components. There is great diversity in patient needs when it comes to weight management. No single program can address the entire range of patient medical needs, schedules, or preferences. Therefore, St. Luke's has chosen to offer a number of weight loss programs designed to meet a wide variety patient circumstances.

### **YEAH!**

Over the last three years, St. Luke's Wood River has engaged hundreds of individuals in weight loss, nutrition, and fitness programs. These programs ranged from body mass index (BMI) screenings in clinics and at health fairs to YEAH!, a wellness program that helps participating children and their families to create healthier lifestyles. Since 2013 we have seen positive changes in multiple aspects of our participants health, including blood pressure, weigh, waist circumference, and quality of life. For instance, 55% of children who participated in 2014 improved their blood pressure, weight status and waist circumference and 60% of parents saw an improvement in their children's quality of life in Spring 2015. In 2016 Wood River YEAH added the component of a "Cooking Demonstration" to the program.

### **HealthyU**

HealthyU is a program provided free of charge to our employees and has proved meaningful when it comes to motivating people to lose weight and maintain their weight loss: from 2014 to 2015, health measures for both the areas of obesity and waist circumference improved by 14% and 12% respectfully among St. Luke's Wood River employees.

## **Group 3: Barriers to Access Programs Ranked as High Priority**

The programs in this section address the needs that center around barriers to access: Affordable care; affordable health insurance; more providers accept public health insurance; and children and family services for low income individuals.

### **Insurance/Payer Inclusion**

All St. Luke's providers and facilities accept all insurances, including Medicare and Medicaid. It is the patient's responsibility to provide the hospital with accurate information regarding health insurance, address, and applicable financial resources to determine whether the patient is eligible for coverage through existing private insurance or through available public assistance programs.

### **Financial Screening and Assistance**

St. Luke's works with patients at financial risk to assist them in making financial arrangements through payment plans or by screening patients for enrollment into available government or privately sponsored programs that they are eligible for. These programs include, but are not limited to, various Medicaid programs, COBRA and County Assistance. St. Luke's does not only screen for these programs, they help the patient navigate through the application process until a determination is made.

In 2014 an additional Financial Navigator was added to ensure support for the uninsured and underinsurance patients at the WR clinics. We also trained 2 staff at the Center for Community Health as In-Person Assisters and enrolled over 300 individuals into an insurance plan that did not previously have insurance as a participant in the Insurance Exchange open-enrollment period. In 2015 and 2016 we continued to enroll individuals who qualify for Exchange plans.

### **Financial Care and Charity**

St. Luke's is committed to caring for the health and well-being of all patients, regardless of their ability to pay for all or part of the care provided. Therefore, St. Luke's offers financial care to patients who are uninsured and underinsured to help cover the cost of non-elective treatment. Charity Care services are provided on a sliding scale adjustment based on income (based on the Federal Poverty Guideline), expenses and eligibility for private or public health coverage. We estimate the impact from charity care and bad debt to be over \$8 million from 2013 through 2016.

### **Information and Referral Services through the St. Luke's Center for Community Health**

The St. Luke's Center for Community Health (CCH) connects our community to local health and mental health providers, social service agencies, government agencies, emergency services, and other nonprofit organizations. The highly trained, bilingual staff meets one-on-one with those who are seeking information and referral services to fully understand all their health and social needs. We work closely with St. Luke's providers to assist their patients in getting connected to services they need to care for themselves and their families and we help them navigate our complex medical system and government services. From 2013 - 2015 we had almost 14,000 client interactions with this service.

### **Compassionate Care Program**

St. Luke's recognizes that health crises and hospitalizations may create financial hardships for patients and their families. In the late fall of 2016, we began our Compassionate Care Program (CCP) in partnership with the St. Luke's Wood River Foundation, providing for emergent needs of patients and their immediate families, excluding hospital and professional fees normally assisted by Patient Financial Services. The CCP resources include, but are not limited to, assistance with food, lodging, transportation, medications, medical supplies, dental services, and other items deemed necessary for improving a patient's health status. Assistance from the CCP is limited to the immediate family members and patients who have been admitted to, or have received services from, St. Luke's, are actively engaged in their health care, and meet financial eligibility requirements.

Since its inception in late October 2016, we have assisted 31 people, utilizing approximately \$8,500 of the fund.

### **Ketchum/Sun Valley Ministerial Fund**

Religious organizations in the community make donations to the Ketchum/Sun Valley Ministerial fund at a level each organization determines for itself. These funds are then distributed to the community by the St. Luke's Center for Community Health and our partner organization, The Advocates for Survivors of Domestic Violence and Sexual Assault. Funds are used primarily for community members needing emergency financial assistance for needs that impact their quality of life, such as utilities, rent, transportation, prescription assistance, and day care. This fund is limited to \$50 per person per year. Since 2013 St. Luke's serves an average of 35-50 people each year, spending a little under \$2,000 of the fund.

### **Group 4: Additional Health Screening and Education Programs Ranked Above the Median**

We recognize the importance of affordable screenings for early detection and preventable health issues especially serving those in our community who are low-income and under- or not insured.

#### **Heart of the Matter Health Screening**

This screening has been offered regularly in our community since the mid-90s, providing an opportunity for the community to access a reduced cost glucose, triglycerides, cholesterol blood test with the addition of an A1c test for those diagnosed with diabetes. Additionally available at the screening events were blood pressure checks and robust health education information about cardiac health, nutrition, exercise, stress management, and other services offered by St. Luke's Wood River. If our lab receives any critical value results, our professional staff calls the participant directly and connects him/her with a primary care physician. In the years 2013-2015 we served over 2,600 people.

For fiscal year 2016 we changed the format of our screening program from a 2-day only screening to a 5 days a week, all year long opportunity to be screened in our primary care clinics, allowing for more access for the community. Lab results can now be sent directly to a participants MyChart account.

### **Brown Bag Health Talks**

Through the Center for Community Health we offer free one-hour health education talks to the community. These talks are held weekly using St. Luke's Wood River physicians, licensed health care professionals, and experts from some of our partner organizations. We provide this service to help educate our community on a multitude of health topics, especially those that address critical unmet health needs as indicated by our CHNA. It also gives our community an opportunity to engage with our clinical professionals, developing relationships outside of the clinic environment. Since 2013 over 1800 people have attended these educational talks.

### **Discover Health Fair**

Held annually, St. Luke's Wood River health fair promotes healthy lifestyles, strong exercise and eating habits, and healthcare education, as well as providing access to discounted laboratory tests. Each year we engage hundreds of community members of all ages with fitness and cooking demonstrations, more than 60 informational booths from community partner organizations, and health care screenings.

### **Breast Screening for the Uninsured and Underinsured Women Project**

The goal of the St. Luke's Wood River Breast Screening for the Uninsured and Underinsured Women Project is to fund screening and/or diagnostic mammograms and/or breast ultrasound for women 25 years of age or older, thus removing cost as a barrier for women accessing breast health services, identifying cancer at an earlier stage when it is easier to treat, and ultimately increasing the survival rate of women receiving support from this project. This project is funded through the Idaho Affiliate, Susan G. Komen for the Cure.

Recognizing the direct connection between access to mammography screening and decreased incidence of cancer and death, St. Luke's Wood River has made it a priority to provide the most advanced breast imaging technology available for all women in our rural service area.

This program is vital in our effort to encourage all women in our community to access mammography services. Given the continuing uncertain economic climate, we anticipate that preventative healthcare services, such as mammograms, are one of the things women will delay to pay for other household expenses. Now, more than ever, women in our community need this assistance. In 2014 and 2015 more than 200 women were served through this funding program, including diagnostic mammograms, screening mammograms, and ultrasound exams.

## Resources Available to Meet Community Needs

This section provides a basic list of resources available within our community to meet some of the needs identified in this document. The majority of resources listed are nonprofit organizations. The list is by no means conclusive and information is subject to change. The various resources have been organized into the following categories:

- Abuse/Violence Victim Advocacy & Services
- Behavioral Health and Substance Abuse Services
- Children & Family Services
- Community Health Clinics and Other Medical Resources
- Disability Services
- Educational Services
- Food Assistance
- Government Contacts
- Hospice Care
- Hospitals
- Housing
- Legal Services
- Public Health Resources
- Residential Care/Assisted Living Facilities
- Senior Services
- Transportation
- Veterans Services
- Youth Programs

## **Abuse/Violence Victim Advocacy & Services**

### **The Advocates for Survivors of Domestic Violence and Sexual Assault**

PO Box 3216

Hailey, Idaho 83333

Phone: (208) 788-4191

24-hour hotline: 208-788-6070

[www.theadvocatesorg.org](http://www.theadvocatesorg.org)

Description: The Advocates' mission is to teach people of all ages how to build and maintain healthy relationships. We accomplish this through education, shelter and support services.

### **Idaho Coalition Against Sexual and Domestic Violence**

E. Mallard Drive, Suite 130

Boise, Idaho 83706

Phone: (208) 384-0419

[info@engagingvoices.org](mailto:info@engagingvoices.org)

Description: The Idaho Coalition Against Sexual & Domestic Violence works to be a leader in the movement to end violence against women and girls, men and boys – across the life span before violence has occurred – because violence is preventable.

### **Idaho Council on Domestic Violence and Victim Assistance**

Phone: (208) 332-1540

Toll-Free: 1-800-291-0463

<http://icdv.idaho.gov/>

Description: The Idaho Council on Domestic Violence and Victim Assistance funds, promotes, and supports quality services to victims of crime throughout Idaho.

### **Idaho Domestic Violence Hotline**

Phone: 1-800-669-3176

## **Behavioral Health and Substance Abuse Services**

### **Al-anon - District 4**

Phone: 24 Hour Information and Answering Service - (208) 344-1661

[www.al-anon-idaho.org](http://www.al-anon-idaho.org)

Description: The Al-Anon Family Groups are a fellowship of relatives and friends of alcoholics who share their experience, strength, and hope, in order to solve their common problems.

### **Alcoholics Anonymous – Idaho Area 18**

Description: At the Y, children and teens learn values and positive behaviors as they're encouraged to explore their unique interests and gifts. This helps to develop confident kids today and contributing adults tomorrow. No one will be denied Y services due to inability to pay.

## Appendix I: Community Representative Descriptions

The process of developing our CHNA included obtaining and taking into account input from persons representing the broad interests of our community. This appendix contains information on how and when we consulted with our community health representatives as well as each individual's organizational affiliation. We interviewed community representatives in each of the following categories and indicated which category they were in.

**Category I: Persons with special knowledge of public health.** This includes persons from state, local, and/or regional governmental public health departments with knowledge, information, or expertise relevant to the health needs of our community.

**Category II: Individuals or organizations serving or representing the interests of the medically underserved, low-income, and minority populations in our community.** Medically underserved populations include populations experiencing health disparities or at-risk populations not receiving adequate medical care as a result of being uninsured or underinsured or due to geographic, language, financial, or other barriers.

**Category III: Additional people located in or serving our community** including, but not limited to, health care advocates, nonprofit and community-based organizations, health care providers, community health centers, local school districts, and private businesses.

- Veterans
- Teens/Adolescents

3) Through your experience, do you feel you understand and can represent the health needs of any of the following population groups?

- Children
- Disabled
- Hispanic population
- Homeless
- Low income individuals and families
- Migrant and seasonal farm workers
- Populations with chronic conditions
- Refugees
- Senior citizens
- Those with behavioral health issues
- Veterans
- Other, please specify \_\_\_\_\_
- Other, please specify \_\_\_\_\_

4) We have compiled a list of potential community health needs based on the results of health assessments and surveys conducted in our community and across the nation. We would like your feedback on the relative importance to our community of each of the potential health needs. As you review the list, please provide us with a score on a scale of 1 to 10 for each potential need. A score of 10 means you believe addressing this need with additional resources would make a large impact to the health of people in our community. A low score means that you believe this item is not an important health need or that it is already being addressed effectively with programs or services in our community.

As you score each need, please describe any programs, legislation, organizations, or other resources you believe are effective in helping us identify or address these health needs.

**Health behavior** (potential needs)

- \_\_\_\_\_ Greater access to healthy foods
- \_\_\_\_\_ Exercise programs/education/opportunities
- \_\_\_\_\_ Help with weight management (to reduce levels of obesity and diabetes)
- \_\_\_\_\_ Nutrition education
- \_\_\_\_\_ Safe sex education programs
- \_\_\_\_\_ Substance abuse services and programs
- \_\_\_\_\_ Tobacco prevention and cessation programs
- \_\_\_\_\_ Wellness and prevention programs (for conditions such as high blood pressure, skin cancer, depression, etc.)

Please describe and score any additional health behavior needs you believe are important:

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Notes on programs, legislation, organizations, and resources:

**Clinical care access and quality (potential needs)**

- \_\_\_\_\_ Affordable health insurance
- \_\_\_\_\_ Affordable care health for low income individuals
- \_\_\_\_\_ Availability of primary care providers
- \_\_\_\_\_ Affordable dental care for low income individuals
- \_\_\_\_\_ Availability of behavioral health services (providers, suicide hotline, etc.)
- \_\_\_\_\_ Chronic disease management programs (for diabetes, asthma, arthritis, etc.)
- \_\_\_\_\_ Immunization programs
- \_\_\_\_\_ Improved health care quality
- \_\_\_\_\_ Integrated, coordinated care (less fragmented care)
- \_\_\_\_\_ Prenatal care programs
- \_\_\_\_\_ Screening programs (cholesterol, diabetes, mammography, colorectal, etc.)

Please describe and score any additional clinical care needs you believe are important:

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Notes on programs, legislation, organizations, and resources:

**Social and economic (potential needs)**

- Children and family services
- Disabled services
- Early learning before kindergarten (such as a Head Start type program)
- Elder care assistance (help in taking care of older adults)
- End of life care or counseling (care for those with advanced, incurable illness)
- Help achieving good grades in kindergarten through high school
- College education support and assistance programs
- Homeless services
- Legal assistance
- Job training services
- Senior services
- Veterans' services
- Violence and abuse services

Please describe and score any additional social/economic needs:

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

Notes on programs, legislation, organizations, and resources:

**Physical environment** (potential needs)

- \_\_\_\_\_ Affordable housing
- \_\_\_\_\_ Healthier air quality, water quality, etc.
- \_\_\_\_\_ Transportation to and from appointments
- \_\_\_\_\_ Healthy transportation options (sidewalks, bike paths, public transportation)

Please describe and score any additional physical environment needs:

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

Notes on programs, legislation, organizations, and resources:

## Appendix III: Summary Scoring Table: Representative Scores Combined with Related Health Outcomes and Factors

### Health Behavior Category

Identified Community Health Needs	Representative Score	Related Health Factors and Outcomes	Health Factor Score	Total Combined Score
Access to healthy foods	6.0	Food environment	9	15
Exercise programs/education/opportunities	5.5	Access to exercise opportunities	8	13.5
		Adult physical activity	7	12.5
		Teen exercise	9	14.5
Nutrition education	5.9	Adult nutrition	9	14.9
		Teen nutrition	10	15.9
Safe sex education programs	6.5	Sexually transmitted infections	9	15.5
		Teen birth rate	5	11.5
Substance abuse services and programs	8.3	Excessive drinking	9	17.3
		Illicit drug use	13	21.3
		Alcohol impaired driving deaths	7	15.3
Tobacco prevention and cessation programs	5.1	Smoking adult	9	14.1
		Smoking teen	10	15.1
Weight management programs	5.9	Obese/Overweight adults	12	17.9
		Obese/Overweight teenagers	13	18.9

Wellness and prevention programs	7.0	Accidents	7	14
		AIDS	7	14
		Alzheimer's	7	14
		Arthritis	4	11
		Asthma	5	12
		Breast cancer	7	14
		Cerebrovascular diseases	8	15
		Colorectal cancer	7	14
		Diabetes	11	18
		Flu/pneumonia	5	12
		Heart disease	8	15
		High blood pressure	7	14
		High cholesterol	9	16
		Leukemia	5	12
		Lung cancer	6	13
		Mental illness	12	19
		Nephritis	8	15
		Non-Hodgkin's lymphoma	6	13
		Obesity	12	19
		Pancreatic cancer	4	11
		Prostate cancer	3	10
Respiratory disease	6	13		
Skin cancer (melanoma)	10	17		
Suicide	12	19		

## Clinical Care Category

Identified Community Health Needs	Representative Score	Related Health Factors and Outcomes	Health Factor Score	Combined Score
Affordable care for low income individuals	8.0	Children in poverty	10	18
Affordable dental care for low income individuals	7.7	Dental visits, preventative	10	17.7
Affordable health insurance	7.7	Uninsured adults	12	19.7
Availability of behavioral health services (providers, suicide hotline, etc)	7.4	Mental health service providers	12	19.4
Availability of primary care providers	5.4	Primary care providers	9	14.4
Chronic disease management programs	5.9	Arthritis	4	9.9
		Asthma	5	10.9
		Diabetes	11	16.9
		High blood pressure	7	12.9
Immunization programs	5.0	Children immunized	9	14
		Adolescents immunized	9	14
		Flu/pneumonia	5	10
Improved health care quality	4.6	Preventable hospital stays	7	11.6
Integrated, coordinated care (less fragmented care)	6.8	No usual health care provider	9	15.8
		Preventable hospital stays	7	13.8
Prenatal care programs	4.7	Prenatal care 1st trimester	8	12.7
		Low birth weight	10	14.7
Screening programs (cholesterol, diabetic, mammography, etc)	4.3	Cholesterol screening	9	13.3
		Colorectal screening	6	10.3
		Diabetic screening	12	16.3
		Mammography screening	9	13.3

## Social and Economic Category

Identified Community Health Needs	Representative Score	Related Health Factors and Outcomes	Health Factor Score	Combined Score
Children and family services	7.0	Children in poverty	9	16
		Inadequate social support	8	15
Disabled services *	5.5	* See note below	8	13.5
Early learning before kindergarten (such as a Head Start type program)	4.8	High school graduation rate	9	13.8
Education: Assistance in achieving good grades in kindergarten through high school	6.2	High school and college education rates	9	15.2
Education: College education support and assistance programs	5.3	High school and college education rates	9	14.3
Elder care assistance (help in taking care of older adults) *	6.7	* See note below	8	14.7
End of life care or counseling (care for those with advanced, incurable illness) *	4.8	* See note below	8	12.8
Homeless services	7.3	Unemployment rate	7	14.3
Job training services	6.1	Unemployment rate	7	13.1
Legal assistance *	5.9	* See note below	8	13.9
Senior services	5.9	Inadequate social support	8	13.9
Veterans' services	6.1	Inadequate social support	8	14.1
Violence and abuse services	5.1	Violent crime rate	6	11.1

\* Disabled services, elder care, end of life care, and legal assistance did not have an objective health factor measure associated with it. Therefore, we used a health factor value equal to the middle range of scores.

## Physical Environment Category

Identified Community Health Needs	Representative Score	Related Health Factors and Outcomes	Health Factor Score	Combined Score
Affordable housing	7.8	Severe housing problems	9.5	17.3
Healthier air quality, water quality, etc	2.9	Air pollution particulate matter	7	9.9
		Drinking water violations	6	8.9
Healthy transportation options (sidewalk, bike paths, public transportation)	4.7	Long commute	5	9.7
		Driving alone to work	7	11.7
Transportation to and from appointments *	6.0	* See note below	8	14

\* Transportation to and from appointments did not have an objective health factor measure associated with it. Therefore, we used a health factor value equal to the middle range of scores.

## Appendix IV: Data Notes

A number of health factor and outcome data indicators utilized in this CHNA are based on information from the Behavioral Risk Factor Surveillance System (BRFSS). Starting in 2011, the BRFSS implemented a new weighting method known as raking. Raking improves the accuracy of BRFSS results by accounting for cell phone surveying and adjusting for a greater number of demographic differences between the survey sample and the statewide population. Raking replaced the previous weighting method known as post-stratification and is a primary reason why results from 2011 and later are not directly comparable to 2010 or earlier. BRFSS data is derived from population surveys. As such, the results have a margin of error associated with them that differs by indicator and by the population measured. For smaller populations, we aggregated data across two or more years to achieve a larger sample size and increase statistical significance. For margin of error information please refer to the CDC for national BRFSS data and to Idaho BRFSS for Idaho related data.
